1. Introduction

This document provides detailed technical information for use of **SpringCard Prox'N'Roll RFID Scanner**.

1.1. AUDIENCE

This reference manual assumes that the reader has expert knowledge of computer configuration and usage. It is designed to be used by system integrators.

1.2. PRODUCT BRIEF

Prox'N'Roll RFID Scanner is a table-top USB proximity reader. It reads serial number or data from any standard ISO/IEC 14443 contactless card, including popular NXP MIFARE and DESFire families, and also ISO/IEC 15693 vicinity tags used in RFID systems.

Prox'N'Roll RFID Scanner supports to operating modes :

- Keyboard emulation mode (default configuration),
- Serial port emulation mode.

1.3. KEYBOARD EMULATION MODE

Configured for **keyboard emulation**¹, **Prox'N'Roll RFID Scanner** outputs its data as if there were typed on the computer's keyboard, just as a bar code scanner behaves.

This allows a drop-in replacement of legacy bar code scanners (PS/2 or USB devices) by a state-of-the-art RFID solution.

a. Typical applications

This reader is primarily dedicated to replace a bar code scanner where RFID labels may be used instead of barcodes: library or book stores, item management,

b. Output configuration

Thanks to the software's configuration (stored in non-volatile memory), the same reader is highly customizable on-the-field :

- Keyboard layout (QWERTY, AZERTY, QWERTZ),
- Keyboard sequences (prefix and postfix) to automate the navigation between the fields in any existing application.

 $^{^{1}}$ The device complies with the USB "Human Interface Device" (HID) profile, keyboard subclass. With most operation systems, no specific driver is needed as the device is seen as a standard computer keyboard.

1.4. SERIAL PORT EMULATION MODE

Configured to emulate a serial port², Prox'N'Roll RFID Scanner outputs its data in a standard serial communication stream.

This configuration typically allows to replace an RS-232 Magstripe reader by a state-of-the-art RFID solution. Replacing former RS-232 bar code scanners is possible too.

a. Typical applications

This reader is primarily dedicated to replace a card reader (Magstripe, 125kHz...) or a bar code scanner in cashiers, top-up kiosks, vending machines...

b. Output configuration

Thanks to the software's configuration (stored in non-volatile memory), the same reader is highly customizable on-the-field:

- Output format,
- Prefix and postfix sequences.

1.5. **RELATED DOCUMENTS**

You'll find any details regarding hardware and physical characteristics of each reader in the corresponding datasheet.

Datasheet	Covered products
PFL8P9P	Prox'N'Roll RFID Scanner product information sheet
PMU84OP	Prox'N'Roll RFID Scanner Quick Start guide

1.6. OTHER PRODUCTS IN THE SAME FAMILY

Prox'N'Roll RFID Scanner firmware is able to run on any other hardware in the SpringCard CSB6 family.

For instance, the SpringCard CrazyWriter OEM contactless coupler may run the Prox'N'Roll RFID Scanner firmware, providing same functionality as tabletop Prox'N'Roll, but in a form factor that may be more convenient for custom integrations.

Due to the wide choice of hardware platforms and the rich portfolio of firmware to cover virtually any requirement, not every combination can be offered as an "out of the shelf" product. Hopefully, SpringCard has a strong experience in offering customized yet flexible products to the integrators. Do not hesitate to contact us in case you need such a specific offer.

² The device complies with the USB "Communication Device Class" (CDC) profile. Drivers are available for most operation systems to have the device activated as a serial communication port.

2. CONFIGURATION ATTRIBUTES

There are two families of configuration attributes:

- Product specific Global Configuration Attributes,
- Card Acceptance Templates.

The Card Acceptance Templates are common to all products in the **SpringCard RFID Scanner family**, and are exposed in detail in the next chapter.

In this chapter, we'll introduce configuration tags and detail the **Prox'N'Roll RFID Scanner**'s specific configuration attributes.

2.1. PRINCIPLES

a. Configuration tags

Each configuration attribute is recognized by its "tag" and its length. The tag is a one-byte value, that uniquely identifies the attribute.

The list of available tags, and their meaning, is the purpose of this chapter and the next one.

Unless specified, each configuration attribute is exactly one byte (8 bits) long.

b. Non-volatile memory endurance

Prox'N'Roll RFID Scanner configuration attributes are stored in reader's non-volatile memory (flash). They can be changed up to 100 times.

Changing any configuration attribute more than 100 times may permanently damage your **Prox'N'Roll RFID Scanner** reader.

2.2. GLOBAL CONFIGURATION ATTRIBUTES

2.2.1. Operating mode

Name	Tag	Description	Size
MOD	_h C0	Operating mode. See table a below.	1

a. Operating mode bits

Bit	Value	Meaning
7 – 4		RFU (set to 0000)
		Operating mode :
3 – 0	0001 0011	Serial emulation mode Keyboard emulation mode

Default value: b00000011

2.2.2. General options

Name	Tag	Description	Size
OPT	_h 60	General options. See table a below.	1

a. General options bits

Bit	Value	Meaning
7		RFU (set to 0)
6	0	Shutdown RF field when idle
	1	Shutdown RF field only when no card detected ³
		Anti-collision model :
5 – 4	00	Process every card one after the other
	01	RFU
	10	When 2 cards are in the field, process the 1^{st} and ignore the 2^{nd}
	11	When 2 cards are in the field, ignore both
		Master Card :
3 – 2	00	Master Cards are disabled ⁴
-	01	Master Cards are enabled at power up
	10	RFU
	11	Master Cards are enabled all the time
		Activate physical serial port ⁵ :
1 – 0	00	Serial port is enabled
	01	RFU
	10	Serial port is disabled
	11	<i>RFU</i>

Default value : $_{b}00001100$

(Master Cards are enabled all the time, serial port enabled)

 $^{^3}$ This is required if strict anti-collision (bits 5-4 = $_b10$ or $_b11$) is needed.

⁴ Configuration settings can only be altered through serial link

⁵ Prox'N'Roll doesn't have a serial port. This attribute is relevant only for CrazyWriter or other hardware platforms that feature an UART with either RS-TTL or RS-232 connection

2.2.3. Delays and repeat options

springcord_

Name	Tag	Description	Min	Max
ODL	_h 61	Min. delay between 2 consecutive outputs (0.1s).	0	100
RDL	_h 62	Min. delay between 2 consecutive <u>identical</u> outputs (0.1s). A value of 255 means that the card must be removed from the field –and re-inserted into– before being read again.	0	100

Default value : ODL = 2 (200ms) RDL = 10 (1s)

2.2.4. LED and buzzer control options

Name	Tag	Description	Size
CLD	_h 63	LEDs control. See table a below.	1
CBZ	_h 64	Buzzer control. See table b below.	1

a. LEDs control bits

Bit	Value	Meaning
7	0	Short LED sequences (3 seconds)
	1	Long LED sequences (10 seconds)
6 – 5	00	When idle, blue LED blinks slowly ("heart beat" sequence)
	01	When idle, blue LED is always on
	10	When idle, blue LED is always off
	11	RFU
4	0	Green LED stays OFF
	1	Green LED blinks when a valid card has been processed
3	0	Red LED stays OFF
	1	Red LED blinks when an unsupported card has been processed
2	0	Green LED stays OFF
	1	Green LED blinks as soon as a card is seen in the field
1 – 0	11	RFU (set to 11)

Default value: b00001111

b. Buzzer control bits

Bit	Value	Meaning
7	0	Buzzer short pulse = 0,2 sec
	1	Buzzer short pulse = 0,5 sec
6	0	Buzzer long pulse = 0,7 sec
	1	Buzzer long pulse = 1,5 sec
5		RFU
4	0	No action on buzzer before specified by host controller
	1	Short pulse when a valid card has been processed
3	0	No action on buzzer for unsupported cards
	1	Long pulse when an unsupported card has been processed
2	0	No action on buzzer before processing is achieved
	1	Short pulse as soon as a card is seen in the field
1 – 0		RFU (set to 11)

Default value: b00010011

2.2.5. Special mode

Name	Tag	Description	Size
SPE	_h 6A	Special configuration bits. See table a below.	1

a. Special configuration bits

Bit	Value	Meaning
7 – 0	0	Normal serial communication
	1	RFU
	2	Add a Checksum at the beginning of the frame ⁶
	3 to	RFU
	255	

Default value: b00000000

2.3. KEYBOARD EMULATION MODE ATTRIBUTES

The following attributes are relevant only when the devices is configured for keyboard emulation (MOD = $_h$ 03)

Name	Tag	Description	Size
KBD.LYT	_h A0	Keyboard layout. See table a below.	1
KBD.OPT	_h A1	Keyboard options. See paragraph b below.	1
KBD.BEF	_h A2	Prefix string. See paragraph c below.	Var.
KBD.AFT	_h A3	Postfix string. See paragraph c below.	Var.

a. Keyboard layout

Bit	Value	Meaning
7 – 0	_h 00	QWERTY
	_h 01	AZERTY using Numeric Pad for number input
	_h 02	QWERTZ
	_h 03	AZERTY using Shift key for number input
		All other values are RFU and must not be used

Default value: b00000000 (QWERTY)

b. Keyboard options

This entry is RFU and must be left empty.

c. Prefix and postfix

KBD.BEF defines the character string do be sent before the actual data.

Default value for KBD.DEF: absent (no prefix)

KBD.AFT defines the character string do be sent after the actual data.

Default value for KBD.DEF: ENTER key

If a non-null ASCII value is specified for either KBD.DEF or KBD.AFT (either a single character or a string), it will be transmitted before of after the data respectively.

Allowed ASCII codes are:

HEX value	C char	Meaning
_h 09	\t	TAB key
_h 0A	\n	ENTER key
_h 0D	\r	(discarded)
_h 20	\ /	Space
_h 41 to _h 5A	`A' to `Z'	Letters A to Z. Actual case vary with CAPS LOCK state.
_h 61 to _h 7A	`a' to `z'	
_h 30 to _h 39	`0' to `9'	Digits 0 to 9 (as if they were entered on the numerical keypad). NUM LOCK must be active.
_h 21 to _h 2F	`!' to `/'	Symbols (put in order) :
_h 3A to _h 40	`:' to `@'	!"#\$%&'()*+,/:;<=>?@ [\]^_`{ }~
_h 5B to _h 60	`[to `` '	
_h 7B to _h 7E	`{' to `~'	
_h 00	\0	End of string

2.4. SERIAL EMULATION MODE ATTRIBUTES

The following attributes are relevant only when the devices is configured for serial emulation (MOD = $_h01$) or when the serial output is enabled (bits 1-0 in OPT).

2.4.1. Serial configuration

Name	Tag	Description	Size
SER	_h 67	Serial configuration bits. See table a below.	1

a. Serial configuration bits

Bit	Value	Meaning			
7	0	No STX / ETX frame markers			
	1	Use STX and ETX as frame markers			
6 – 5	00	No BEL / TAB / CR/LF frame markers			
	01	Use CR/LF only			
	10	Use BEL and CR/LF as frame markers			
	11	Use TAB and CR/LF as frame markers			
4 – 3		rial Repeat			
	00	epeat			
	01	Repeat 4 times with timeout of 100ms			
	10	Repeat 4 times with timeout of 250ms			
	11	Repeat 9 times with timeout of 250ms			
2 – 0		RFU (set to 101)			

Default value: b11000000

The baudrate is always 38400 bps.

b. Serial frame format

Serial frames are always transmitted using ASCII representation of binary values.

For example, data '00 7A 12 6C 59 F4 04' (hexadecimal notation) is transmitted as string "007A126C59F404".

c. Serial frame markers

Bits 7-5 drive the start of frame / end of frame markers.

See chapter 4.1 for details on using the reader in Serial mode.

2.5. OTHER ATTRIBUTES

2.5.1. PIN code

Name	Tag	Description	Size
PIN	_h 6F	PIN code to access reader's console.	2

Default value: empty (no pin-code)

Use this tag to define a 4 digits PIN code to protect access to reader's console.

The 2-byte value must store 4 valid BCD digits, or the reserved value hFFFF that permanently disables the console feature.

3. CARD ACCEPTANCE TEMPLATES

Products in the **SpringCard RFID Scanners** family are able to manage different types of cards, and different sources of data on each card.

A **Card Acceptance Template** defines how the reader will recognize the card to be read, and how it would get the actual data (serial number, block reading, file selection and reading, authentication keys to be used for Mifare or Desfire, etc).

The template also defines which formatting is to be applied to the data when sending them to the target device (translation to ASCII or to Decimal, constant prefix or suffic, etc).

This product is able to run up to 4 Card Acceptance Templates simultaneously.

3.1. BASIS

Each Card Acceptance Template is configured through a set of configuration attributes, each attribute having its own tag.

- Template 1 uses Configuration tags h10 to h1F
- Template 2 uses Configuration tags h20 to h2F
- Template 3 uses Configuration tags h30 to h3F
- Template 4 uses Configuration tags h40 to h4F

In the following pages, we use the convention "Template t uses Configuration tags $_{\rm h}$ t0 to $_{\rm h}$ tF ". Replace t by the current template number.

3.1.1. Card lookup list

Name	Tag	Description	Size
LKL	_h t0	Card lookup list of the template. See table a below.	1

a. Available values for LKL

Value	Card(s) accepted by the template	Processing template	§
_h 01	ISO/IEC 14443 type A (layer 3)	ID only	3.2
_h 02	ISO/IEC 14443 type B (layer 3)		
_h 03	ISO/IEC 14443 A&B (layer 3)		
_h 04	ISO/IEC 15693		
_h 07	ISO/IEC 14443 A&B and ISO/IEC 15693		
_h 08	NXP ICODE1		
_h 0C	NXP ICODE1 and ISO/IEC 15693		
_h 0F	All of the above		
_h 11	ISO/IEC 14443 type A (layer 4 / T=CL)	7816-4	3.6
_h 12	ISO/IEC 14443 type B (layer 4 / T=CL)		
_h 13	ISO/IEC 14443 A&B (layer 4 / T=CL)		
_h 22	ST MicroElectronics SR family	ID only	3.2
_h 23	ASK CTS256B and CTS512B		
_h 24	Inside Contactless PicoTAG ⁷		
_h 61	NXP Mifare Classic 1k & 4k	Mifare Classic	3.3
_h 62	NXP Mifare UltraLight	Mifare UltraLight	3.4
_h 71	NXP Desfire 4k	Desfire	3.5
			1
_h 72	Calypso (Innovatron protocol)	ID only or 7816-4	3.2 or 3.7
			1
_h FF	All cards supported	ID only	3.2

Other values are RFU

The LKL tag is mandatory to enable a template group. If not found, the template group is empty.

3.1.2. Summary of other tags in templates

Depending of the card lookup list (LKL tag), a specific list of tags controls the behaviour of the Processing Template.

The table below summarize this.

Tag	ID only	Mifare UltraLight	Mifare Classic	Desfire	7816-4	Calypso
_h t1			Output	format		
_h t2	Output prefix					
_h t3	Offset	Location of data				
_h t4	Options			T=CL (ptions	C. options
_h t5			Auth. met	hod & key	1 st A	PDU
_h t6			Sign. met	hod & key	2 nd A	APDU
_h t7					3 rd A	\PDU

Grey items are RFU and must be kept empty.

3.1.3. Important notice regarding template-ordering

Be careful that the 4 templates are processed one after the other. The loop is ended after the first successful match.

If a card matches two (or more) templates, it will be handled only by the first one.

Suppose you want to accept both a specific kind of 14443-B T=CL cards, with advanced file reading, and another kind of wired-logic 14443-B cards, where only the ID is significant. You must put the T=CL template *before* the ID template, otherwise the T=CL part will be skipped.

3.2. ID-ONLY ACCEPTANCE TEMPLATES

Use an ID-only Acceptance Templates when you want to read the serial number and/or the protocol-related constant bytes from a contactless card, or a group of contactless cards.

Depending on the settings you define in the Lookup List attribute (tag LKL.IDO), the reader may either

- Find any supported contactless card,
- · Find only a specific family of contactless cards,
- Find ISO compliant contactless cards.

As you may have more than one ID-only Acceptance Template (up to 4 in fact), you may easily display different types of cards with a different format.

Including card's type in the returned ID is also an interesting option (see 3.2.6.b), as for instance there's no rule to prevent an ISO 14443-B card to have a different serial number than any ISO 14443-A ones.

3.2.1. Lookup list

Name	Tag	Description	Size
LKL.IDO	_h t0	ID-only lookup list :	1
		$_{h}01 \le value \le _{h}0F$ for ISO-compliant cards,	
		$_{h}21 \le value \le _{h}2F$ for non-ISO cards,	
		value = $_{h}$ FF all the supported cards.	
		See 3.1.1.a for details.	

3.2.2. Output format

Name	Tag	Description	Size
TOF.IDO	_h t1	ID-only output format. See table a below.	1

a. Output format bits

Bit	Value	Meaning
		Byte swapping
7 – 6	00	Do not swap ID bytes (ID is transmitted "as is")
	01	RFU
	10	Swap bytes for single-size (4 bytes) ISO 14443-A UIDs ⁸ only; IDs of any other
		card is transmitted "as is"
	11	Swap ID bytes for all kind of cards
		Padding
5	0	Left-padding with _h 0
	1	Right-padding with _h F
		ISO 14443-B specific
4	0	Use ISO 14443-B PUPI (4 bytes) as ID
	1	Use complete ISO 14443-B ATQ (11 bytes) as ID
		Output length
3 - 0	0000	Decimal, 4 bytes seen as 10 digits (i.e. $32 \rightarrow 40$ bits expansion)
	0001	Fixed length, 4 bytes ⁹
	0010	Fixed length, 8 bytes ¹⁰
	0011	Fixed length, 5 bytes
	0100	Fixed length, 12 bytes 11
	0101	Fixed length, 7 bytes ¹²
	0110	Fixed length, 11 bytes ¹³
	0111	RFU
	1000	Fixed length, 16 bytes
	1001	RFU
	1010	RFU
	1011	RFU
	1100	Decimal, 5 bytes seen as 12 digits (i.e. $40 \rightarrow 56$ bits expansion)
	1101	Decimal, 5 bytes seen as 13 digits (i.e. $40 \rightarrow 64$ bits expansion)
	1110	Decimal, variable length (maximum 13 digits)
	1111	Variable length (depends on actual size of ID)

Default value: b10000010

(8 bytes fixed length, left padding, swap bytes for short ISO 14443-A UIDs only)

 $^{^{\}rm 8}$ This is the default format in NXP's Mifare Classic related literature.

⁹ ISO 14443-A single-size UID, ISO 14443-B PUPI, serial number for ASK CTS256B and CTS512B.

 $^{^{\}rm 10}$ ISO 15693 ID, serial number for NXP ICODE1, Inside Contactless PicoTag, ST MicroElectronics SR family...

¹¹ ISO 14443-A triple-size UID.

¹² ISO 14443-A double-size UID.

 $^{^{13}}$ ISO 14443-B complete ATQB.

3.2.3. Output prefix

Name	Tag	Description	Size
PFX.IDO	_h t2	ID-only output prefix.	Var.

Default value: absent (no prefix)

If a non-null ASCII value is specified (either a single character or a string), it will be transmitted before the data (therefore the actual length will be longer than the specified length).

3.2.4. Offset of data

Name	Tag	Description	Size
LOC.IDO	_h t3	Offset in the ID.	1

Default value : $_{b}00000000 (_{d}0)$

When TOF.IDO specifies a fixed length output, using LOC.IDO makes it possible to select some bytes in the ID, and not only the first ones. This is principally useful when working with non-ISO cards, as shown in the following paragraphs.

3.2.5. Role of LOC.IDO with non-ISO cards

A few manufacturers still offer non standard cards, most of them based on ISO 14443-B bit-level specification, but with a proprietary frame format (protocol) and a proprietary command set.

As those cards don't answer to ISO 14443 standard detection commands, a specific template must be activated to discover them.

a. ST MicroElectronics SR family

When LKL.IDO= $_h$ 22, the reader performs the lookup sequence for cards in the ST MicroElectronics SR family (SR176, SRX, SRIX).

A 8-byte serial number is returned by the card. Use TOF.IDO and LOC.IDO if you need to truncate it.

b. ASK CTS256B and CTS512B

When LKL.IDO= $_h$ 23, the reader performs the lookup sequence for cards in the ASK CTS-B family (CTS256B, CTS512B).

A 8-byte identifier is built as follow:

Byte 0	Byte 1	Byte 2	Byte 3	Bytes 4 to 7
Manufacturing	Product code	Embedded code	Application code	4-byte serial
code				number

- CTS256B's product code is between h50 and h5F,
- CTS512B's product code is between h60 and h6F,
- See ASK's documentation for explanations regarding other bytes.

Define LOC.IDO= $_h04$ (and TOF.IDO= $_h01$) if you need only the serial number (and don't care for card type and other data).

c. Inside Contactless PicoTAG14

When LKL.IDO= $_h$ 24, the reader performs the lookup sequence for cards in the Inside Contactless PicoTAG family (PicoTAG 16KS).

A 8-byte serial number is returned by the card. Use TOF.IDO and LOC.IDO if you need to truncate it.

14 Also HID iClass

3.2.6. Miscellaneous options

Name	Tag	Description	Size
OPT.IDO	_h t4	ID-only miscellaneous options. See table a below.	1

a. Miscellaneous option bits

Bit	Value	Meaning
7 – 4		RFU
3 – 2	00 01 10 11	Position of card's type in the output Card type is sent before the prefix ¹⁵ Card type is sent after the prefix and before the ID ¹⁶ Card type is sent after the actual ID ¹⁷ RFU
1 – 0	00 01 10 11	Send card's type in the output Do not send card's type Send card's type on one byte (2 hex digits) (see table b below) Send card's type as a string (see table b below) RFU

Default value: b00000000

b. Values for card's type byte or string

When OPT.IDO is configured to send card's type in the output, the possible values are :

"Physical" card's type	One byte value	String value	Remark
ISO/IEC 14443 A	_h 01	" A "	Card must be compliant with Layer
ISO/IEC 14443 B	_h 02	" B "	3 or layer 4
ISO/IEC 15693	_h 04	" V "	
NXP ICODE1	_h 08	" I "	
Inside Contactless PicoTAG	_h 10	" i "	Also HID iClass
ST MicroElectronics SR family	_h 20	" s "	
ASK CTS256B and CTS512B	_h 40	" a "	
Calypso (Innovatron protocol)	_h 80	" C "	

¹⁵ The actual frame is <card type><PFX.IDO><card id> (PFX.IDO may be empty)

¹⁶ The actual frame is <PFX.IDO><card type><card id> (PFX.IDO may be empty)

 $^{^{17}}$ The actual frame is <PFX.IDO><card id><card type> (PFX.IDO may be empty)

3.3. MIFARE CLASSIC ACCEPTANCE TEMPLATE

Mifare "Classic" refers to NXP Mifare 1k (MF1ICS50) and Mifare 4k (MF1ICS70) wired-logic contactless cards.

Mifare 1k is divided into 64 16-byte blocks.

Mifare 4k is divided into 256 16-byte blocks.

Both cards have a 4-byte serial number, located at the beginning of block 0. As those cards are ISO/IEC 14443-3 compliant, you can read the serial number through the generic ID-Only template, instead of using this dedicated template.

3.3.1. Lookup list

Name	Tag	Description	Size
LKL.MIF	_h t0	Mifare classic lookup list, value = h61.	1
		See 3.1.1.a for details.	

3.3.2. Output format

Name	Tag	Description	Size
TOF.MIF	ht1	Mifare output format. See table a below.	1

a. Output format bits

	Bit	Value	Meaning
7		0	Do not swap bytes
		1	Swap bytes
6		0	RAW data
		1	ASCII encoded data ¹⁸
5			RAW : padding mode (when bit 6= 0 and read length < specified output length)
		0	Left-padding with _h 0
		1	Right-padding with _h F
			ASCII : padding mode (when bit 6= 1 and read length < specified output length)
		0	Left-padding with <space></space>
		1	Right-padding with <space></space>
4			RAW : strip leading zeros (when bit 6= 0)
		0	Do not remove leading zeros
		1	Do remove leading zeros
			ASCII : long string option (when bit $6=1$) ¹⁹
		0	Disable long string reading option
		1	Enable long string reading option
			Output length
3 –	- 0		Format depends on bit 6 (RAW or ASCII).
			See table b below for RAW data (bit $6 = 0$)
			See table \mathbf{c} below for ASCII data (bit $6 = 1$)

Default value: b00000010

¹⁸ If data read from the memory card is "31 32 33 43 34" (hexadecimal notation), output will be "123C45". Make sure that only valid digits (values from 31 to 39 and 41 to 46 or 61 to 66) are encoded in every card, otherwise actual reader output will be undefined.

¹⁹ This option is only available on Prox'N'Roll RFID Scanner, RDR-K632 and ProxRunner. If working with IWM-K632 or FunkyGate, please ignore this configuration tag.

b. Output length when bit 6 = 0

Bit	Value	Meaning
3 - 0	0000	Decimal, 4 bytes seen as 10 digits (i.e. 32 → 40 bits expansion)
	0001	Fixed length, 4 bytes (32 bits)
	0010	Fixed length, 8 bytes (64 bits)
	0011	Fixed length, 5 bytes (40 bits)
	0100	Fixed length, 12 bytes (96 bits)
	0101	Fixed length, 7 bytes (56 bits)
	0110	Fixed length, 11 bytes (88 bits)
	0111	RFU
	1000	Fixed length, 16 bytes (128 bits)
	1001	RFU
	1010	RFU
	1011	RFU
	1100	Decimal, 5 bytes seen as 12 digits (i.e. $40 \rightarrow 56$ bits expansion)
	1101	Decimal, 5 bytes seen as 13 digits (i.e. $40 \rightarrow 64$ bits expansion)
	1110	Decimal, variable length (maximum 13 digits)
	1111	Variable length (using h0 and hF as end of string markers)

c. Output length when bit 6 = 1

Bit	Value	Meaning
3 – 0	0000	Max output length = d16
	0001	
	to	Max output length from $_{ m d}1$ to $_{ m d}15$
	1111	

3.3.3. Output prefix

Name	Tag	Description	Size
PFX.MIF	_h t2	Mifare output prefix.	Var.

Same as ID-only output prefix (see 3.2.3).

3.3.4. Location of data

Depending on the size, the LOC.MIF tag can either be

- A block number (= address of data in Mifare card) when size = 1,
- An Application Identifier (AID) when size = 2.

a. Fixed block number

Name	Tag	Description	Size
LOC.MIF	_h t3	Block number to be read.	1

Default value : $_{b}00000100 (_{d}4)$

When a Mifare card is found, the reader tries to read the block specified in LOC.MIF (16 bytes), and then truncates the data according to the length specified in TOF.MIF.

The block number shall be

- Between 0 and 63 for Mifare 1k cards,
- Between 0 and 255 for Mifare 4k cards.

Note that data must start on a block boundary.

Mifare sector trailers (security blocks) numbered 3, 7, ... can be read, but their content is masked (to protect the keys). Using such a block as access control identifier is definitely not a good idea.

b. AID in MAD

Name	Tag	Description	Size
LOC.MIF	_h t3	AID to be selected and read.	2

When a Mifare card is found, reader reads the MAD (blocks 1 and 2 of sector 0)²⁰ and tries to find the specified AID. The location of the AID in the MAD is the pointer onto the actual block to be read.

Note that data must be located at the beginning of the first block marked with the specified AID.

Please refer to NXP application notes for detailed explanations of the MAD.

 $^{^{20}}$ Sector 0 must be freely readable either with base key A ("A0 A1 A2 A3 A4 A5"), with transport key ("FF FF FF FF FF") or with the application key specified in AUT.MIF.

3.3.5. Authentication key

Depending on the size, the AUT.MIF tag can either be

- A pointer to a key located in RC's secure EEPROM when size = 1.
- The Mifare key itself, when size = 7,
- A master key and its diversification options, when size = 9 or 17

When the AUT.MIF tag is absent, all EEPROM keys are tried out in sequence (this can take a long time...).

Name	Tag	Description	Size
AUT.MIF	_h t5	Mifare authentication key.	See below

Default value: absent

a. Size = 1 : pointer to a key in RC's secure EEPROM

- Values h00 to h0F refer to type A keys d0 to d15, respectively,
- Values $_h80$ to $_h8F$ refer to type B keys $_d0$ to $_d15$, respectively.

b. Size = 7 : specified Mifare key

Offset	Length	Content
0	1	Key options. See table c below.
1	6	Mifare key value.

c. Key options bits, when size = 7

Bit	Value	Meaning
7	0	Key is an A key
	1	Key is a B key
6 – 0		RFU

d. Size = 17 : master key diversification using HMAC-MD5

Offset	Length	Content
0	1	Key options. See table e below.
1	16	Master key value.

e. Key options bits, when size = 17

Bit	Value	Meaning
7	0	Diversified key is an A key
	1	Diversified key is a B key
6	0	Diversification with card UID and address fixed to h00
	1	Diversification with card UID and address = sector number
5 – 4	10	Diversify the key using HMAC-MD5 algorithm
3 – 0		RFU

f. Size = 15 or 23 : master key diversification using RC171 algorithm

Offset	Length	Content
0	1	Key options. See table g below.
1	6	Mifare master key.
7	8 or 16	DES or 3-DES diversification key.

g. Key options bits, when size = 15 or 23

Bit	Value	Meaning
7	0	Diversified key is an A key
	1	Diversified key is a B key
6	0	Diversification with card UID and address fixed to h00
	1	Diversification with card UID and address = sector number
5 – 4	01	Diversify the key using RC171 algorithm
3 – 0		RFU

3.3.6. Reading a long string from a Mifare Classic card

Note: This option is only available on Prox'N'Roll RFID Scanner, RDR-K632 and ProxRunner.

When bits 4 and 6 in TOF.MIF are set (ASCII output, long string reading extension enabled), the reader behaves as follow:

- The output length (bits 0 to 3 of TOF.MIF) is ignored,
- The reader reads sequentially all Mifare data blocks starting at address specified in LOC.MIF (absolute address or pointer found in MAD), until one of those events occurs:
 - \circ The end-of-string character ('\0' i.e. $_h00$) is read,
 - The end of the card is reached,
 - The authentication failed (see note below),
 - o 4 blocks (64 bytes) have been read.

Doing so, the reader is able to fetch ASCII strings up to 64 characters.

Note: in this mode, the reading may cross a sector boundary (64 bytes is 4 blocks, where sectors below 32 are 3-block wide). In this case, the two sectors to be read must be formatted with the same Mifare key and the same access mode.

3.4. MIFARE ULTRALIGHT ACCEPTANCE TEMPLATE

NXP Mifare UltraLight is a low-cost wired-logic contactless cards. It is divided into 16 4-byte pages. This template reads 4 pages (i.e. exactly 16 bytes) at once.

This card has a 7-byte serial number, located on blocks 0 and 1. As the card is ISO/IEC 14443-3 compliant, you can read the serial number through the generic ID-Only template, instead of using this dedicated template.

3.4.1. Lookup list

Name	Tag	Description	Size
LKL.MFU	_h t0	Mifare UltraLight lookup list, value = h62.	1
		See 3.1.1.a for details.	

3.4.2. Output format

Name	Tag	Description	Size
TOF. MFU	_h t1	Mifare UltraLight output format.	1

Same as Mifare Classic output format (see 3.3.2).

3.4.3. Output prefix

Name	Tag	Description	Size
PFX.MFU	_h t2	Mifare UltraLight output prefix.	Var.

Same as ID-only output prefix (see 3.2.3).

3.4.4. Location of data

Name	Tag	Description	Size
LOC.MFU	_h t3	Number of the first page to be read.	1

Default value : $_{b}00000000 (_{d}0)$

Remember that this template always reads 4 pages (16 bytes) starting at LOC.MFU.

3.4.5. Reading a long string from a Mifare UltraLight card

Note: This option is only available on Prox'N'Roll RFID Scanner, RDR-K632 and ProxRunner.

When bits 4 and 6 in TOF.MIF are set (ASCII output, long string reading extension enabled), the reader behaves as follow:

- The output length (bits 0 to 3 of TOF.MIF) is ignored,
- The reader reads sequentially all Mifare data blocks starting at address specified in LOC.MIF (absolute address or pointer found in MAD), until one of those events occurs :
 - o The end-of-string character ($\oldsymbol{``\0'}$ i.e. $_h00$) is read,
 - The end of the card is reached,
 - 16 pages (64 bytes) have been read.

Doing so, the reader is able to return ASCII strings up to 64 characters²¹.

²¹ Well, not really, as Mifare UltraLight currently features only 64 bytes of data, with only 48 bytes actually usable to store data.

3.5. DESFIRE ACCEPTANCE TEMPLATE

Desfire Acceptance Template has been designed for the first version of NXP Desfire 4k cards (MF3ICD40).

It should work with new Desfire versions (MF3ICD21, MF3ICD41 and MF3ICD81) as long as they are configured to remain compatible with the earlier version (DES or two-key Triple-DES authentication, same ATQ/SAK as MF3ICD40).

3.5.1. Lookup list

Name	Tag	Description	Size
LKL.DFR	_h t0	Desfire lookup list, value = h71.	1
		See 3.1.1.a for details.	

3.5.2. Output format

Name	Tag	Description	Size
TOF.DFR	_h t1	Desfire output format.	1

Same as Mifare Classic output format (see 3.3.2).

3.5.3. Output prefix

Name	Tag	Description	Size
PFX.DFR	_h t2	Desfire output prefix.	Var.

Same as ID-only output prefix (see 3.2.3).

3.5.4. Location of data

Name	Tag	Description	Size
LOC.DFR	_h t3	Location of data in Desfire card. See table a below.	8

a. Data location bytes

Offset	Length	Content
0	3	Application IDentifier (AID).
3	1	File IDentifier (FID). File must be a "standard data" file.
4	3	Offset of data in file.
7	1	Length of data to be read ²² (1 to 64).

Default value: unspecified.

Values are MSB first.

 $^{^{22}}$ Data will be truncated to the length specified in TOF.DFR, unless the long string reading extension is enabled.

3.5.5. T=CL options

Name	Tag	Description	Size
OPT.DFR	րt4	Desfire T=CL options.	1

Same as 7816-4 T=CL options (see 3.5.5).

3.5.6. Authentication key

Name	Tag	Description	Size
AUT.DFR	_h t5	Desfire authentication key. See table a below.	9 or 17

Default value: absent

(No authentication is performed, plain read operation is used to fetch the data)

a. Authentication key bytes

Offset	Length	Content
0	1	Desfire key index and options. See table b below.
1	8 or 16	Key value (8 bytes for a DES key, 16 bytes for a 3-DES key).

b. Key index and options

Bit	Value	Meaning
		Communication mode for reading
7 – 6	00	Plain
	01	MACed with session key
	10	<i>RFU</i>
	11	Enciphered with session key
		Key diversification algorithm
5 – 4	00	Use the key "as is"
	01	Diversify the key using Desfire SAM algorithm
	10	Diversify the key using HMAC-MD5 algorithm
	11	RFU
		Index of key in Desfire application
3 – 0	0000	
	to	Index of the key to be used for authentication
	1110	
	1111	RFU

3.5.7. Reading a long string from a Desfire card

Note: This option is only available on Prox'N'Roll RFID Scanner, RDR-K632 and ProxRunner.

When bits 4 and 6 in TOF.DFR are set (ASCII output, long string reading extension enabled), the reader behaves as follow:

- The output length (bits 0 to 3 of TOF.DFR) is ignored,
- The reader reads the data up to the length specified in LOC.DFR (64 bytes max.),
- The reader returns those bytes as an ASCII string, truncated at the correct length when the end-of-string character ('\0' i.e. h00) is reached.

Doing so, the reader is able to fetch ASCII strings up to 64 characters.

3.6. ISO 7816-4 ACCEPTANCE TEMPLATE

3.6.1. Lookup list

Name	Tag	Description	Size
LKL.TCL	_h t0	7816-4 lookup list, $h11 \le \text{value} \le h13$.	1
		See 3.1.1.a for details.	

3.6.2. Output format

Name	Tag	Description	Size
TOF.TCL	_h t1	T=CL output format.	1

Same as Mifare Classic output format (see 3.3.2).

3.6.3. Output prefix

Name	Tag	Description	Size
PFX.TCL	հt2	T=CL output prefix.	Var.

Same as ID-only output prefix (see 3.2.3).

3.6.4. Location of data

Name	Tag	Description	Size
LOC.TCL	_h t3	Offset of data in answer to APDU 3 ²³ (0 to 127).	1

Default value: 0.

3.6.5. T=CL options

Name	Tag	Description	Size
OPT.TCL	_h t4	T=CL (ISO/IEC 14443 layer 4) options. See table a below.	1

 $^{\rm 23}$ Data will be truncated according to the length specified in TOF.TCL .

a. T=CL option bits

Bit	Value	Meaning
		Card to reader baudrate
7 – 6	00	No PPS, DSI = 106kbit/s
. •	01	Perform PPS, DSI = 212kbit/s if card allows it
	10	Perform PPS, DSI = 424kbit/s if card allows it
	11	Perform PPS, DSI = 848kbit/s if card allows it
		Reader to card baudrate
5 – 4	00	No PPS, DRI = 106kbit/s
	01	Perform PPS, DRI = 212kbit/s if card allows it
	10	Perform PPS, DRI = 424kbit/s if card allows it
	11	Perform PPS, DRI = 848kbit/s if card allows it
		Card identifier (CID)
3 – 0	0000	Empty CID = $_{d}$ 0
	0001	
	to	CID from _d 1 to _d 14
	1110	
	1111	CID is disabled

This tag exists only if T=CL card is selected in LST.

Default value: b00001111

3.6.6. T=CL APDU 1

Typically this is a Select Application (or Select Applet) command.

May be absent if T=CL APDU 3 is sufficient to fetch the data.

Name	Tag	Description	Size
AU1.TCL	_h t5	TCL APDU 1.	Var.

Card's Status Word is checked by the reader. A SW between $_{\rm h}9000$ and $_{\rm h}9FFF$ is considered valid. Any other value for SW (and in particular error values as defined by ISO 7816-4 between $_{\rm h}6100$ and $_{\rm h}6FFF$) is considered as an error, and the reader will ignore the card.

Reader's internal buffer is limited to 128 bytes. If card's answer is longer, the answer will be discarded and the reader will ignore the card.

3.6.7. T=CL APDU 2

Typically this is a Select File command.

May be absent if T=CL APDU 3 is sufficient to fetch the data.

Name	Tag	Description	Size
AU2.TCL	_h t6	TCL APDU 2.	Var.

Card's Status Word is checked by the reader. A SW between $_{\rm h}9000$ and $_{\rm h}9FFF$ is considered valid. Any other value for SW (and in particular error values as defined by ISO 7816-4 between $_{\rm h}6100$ and $_{\rm h}6FFF$) is considered as an error, and the reader will ignore the card.

Reader's internal buffer is limited to 128 bytes. If card's answer is longer, the answer will be discarded and the reader will ignore the card.

3.6.8. T=CL APDU 3

APDU used to actually retrieve the data (typically this is a Read Binary command). Data have to be found in answer at offset specified in LOC.TCL.

Name	Tag		Description	Size
AU3.TCL	_h t7	TCL APDU 3.		Var.

Card's Status Word is checked by the reader. A SW between $_{\rm h}9000$ and $_{\rm h}9FFF$ is considered valid. Any other value for SW (and in particular error values as defined by ISO 7816-4 between $_{\rm h}6100$ and $_{\rm h}6FFF$) is considered as an error, and the reader will ignore the card.

Reader's internal buffer is limited to 128 bytes. If card's answer is longer, the answer will be discarded and the reader will ignore the card.

3.6.9. Reading a long string from a T=CL card

Note: This option is only available on Prox'N'Roll RFID Scanner, RDR-K632 and ProxRunner.

When bits 4 and 6 in TOF.TCL are set (ASCII output, long string reading extension enabled), the reader behaves as follow:

- The output length (bits 0 to 3 of TOF.TCL) is ignored,
- The reader fetches the data from offset LOC.TCL up to the length of the response to APDU 3 (64 bytes max.),
- The reader returns those bytes as an ASCII string, truncated at the correct length when the end-of-string character ('\0' i.e. h00) is reached.

Doing so, the reader is able to fetch ASCII strings up to 64 characters.

3.7. CALYPSO ACCEPTANCE TEMPLATE

This part deals with old Calypso cards, to be accessed only through the legacy Innovatron radio protocol.

New Calypso cards now support ISO/IEC 14443-B, and therefore can be accessed either through ID-Only or ISO/IEC 7816-4 templates.

Working with Calypso cards is subject to a specific licence fee. This function is therefore disabled in our readers, unless you order them with the Calypso option.

Depending on the specified options, this Calypso card processing template can retrieve :

- A 4-byte serial number (ID-Only template)
- Arbitrary data to be read in Calypso files (7816-4 template)

3.7.1. Lookup list

Name	Tag	Description	Size
LKL.CYO	_h t0	Calypso/Innovatron lookup list, value = h72.	1
		See 3.1.1.a for details.	

3.7.2. Output format

Name	Tag	Description	Size
TOF.CYO	ht1	Calypso/Innovatron output format.	1

Same as Mifare Classic output format (see 3.3.2).

3.7.3. Output prefix

Name	Tag	Description	Size
PFX.CYO	_h t2	Calypso/Innovatron output prefix.	Var.

Same as ID-only output prefix (see 3.2.3).

3.7.4. Location of data

Name	Tag	Description	Size
LOC.CYO	_h t3	Offset of data in answer to APDU 3 ²⁴ (0 to 64).	1

Default value: 0.

3.7.5. Calypso APDU 1

Typically this is a Select Application, or Select DF command.

Name	Tag	Description	Size
AU1.CYO	_h t5	Calypso/Innovatron APDU 1.	Var.

Card's Status Word is checked by the reader. A SW between $_{\rm h}9000$ and $_{\rm h}9FFF$ is considered valid. Any other value for SW (and in particular error values as defined by ISO 7816-4 between $_{\rm h}6100$ and $_{\rm h}6FFF$) is considered as an error, and the reader will ignore the card.

Reader's internal buffer is limited to 128 bytes. If card's answer is longer, the answer will be discarded and the reader will ignore the card.

3.7.6. Calypso APDU 2

Typically this is a Select EF command.

Name	Tag	Description	Size
AU2.CYO	_h t6	Calypso/Innovatron APDU 2.	Var.

Card's Status Word is checked by the reader. A SW between $_{\rm h}9000$ and $_{\rm h}9FFF$ is considered valid. Any other value for SW (and in particular error values as defined by ISO 7816-4 between $_{\rm h}6100$ and $_{\rm h}6FFF$) is considered as an error, and the reader will ignore the card.

Reader's internal buffer is limited to 128 bytes. If card's answer is longer, the answer will be discarded and the reader will ignore the card.

 $^{^{24}}$ Data will be truncated according to the length specified in TOF.CYO .

PROX'N'ROLL RFID SCANNER - Reference manual

3.7.7. Calypso APDU 3

Typically this is a Read Binary command.

Name	Tag	Description	Size
AU3.CYO	_h t7	Calypso/Innovatron APDU 3	Var.

Card's Status Word is checked by the reader. A SW between $_{\rm h}9000$ and $_{\rm h}9FFF$ is considered valid. Any other value for SW (and in particular error values as defined by ISO 7816-4 between $_{\rm h}6100$ and $_{\rm h}6FFF$) is considered as an error, and the reader will ignore the card.

Reader's internal buffer is limited to 128 bytes. If card's answer is longer, the answer will be discarded and the reader will ignore the card.

4. SERIAL PROTOCOL AND COMMAND SET

4.1. SERIAL OUTPUT FORMAT

4.1.1. Frame markers

Serial frame markers are configured by bits 7-5 of SER.

Consider data '01 23 45 67' with a prefix <BEF> and postfix <AFT>,

- If bits 7-5 = $_{b}$ 000, frame is "<BEF>01234567<AFT>".
- If bits 7-5 = $_{b}$ 001, frame is "<BEF>01234567<AFT><CR><LF>" where <CR> the ASCII carriage return ($_{h}$ 0D), and <LF> the ASCII line feed ($_{h}$ 0A).
- If bits 7-5 = $_b010$, frame is "<BEL><BEF>01234567<AFT> <CR> <LF>" where <BEL> is the ASCII bell (or ring) character ($_h07$), <CR> the ASCII carriage return ($_h0D$), and <LF> the ASCII line feed ($_h0A$).
- If bits 7-5 = $_b011$, frame is "<TAB><BEF>01234567<AFT><CR><LF>" where <TAB> is the ASCII horizontal tab character ($_h09$), <CR> the ASCII carriage return ($_h0D$), and <LF> the ASCII line feed ($_h0A$).
- If bits 7-5 = $_{b}100$, frame is "<STX><BEF>01234567<AFT><ETX>" where <STX> is the ASCII "start of text" character ($_{h}02$), and <ETX> the ASCII "end of text" ($_{h}03$).
- If bits 7-5 = $_{b}$ 101, frame is "<STX><BEF>01234567<AFT><ETX><CR><LF>".
- If bits 7-5 = $_b$ 110, frame is "<BEL><STX><BEF>01234567<AFT><ETX><CR><LF>".
- If bits 7-5 = $_b$ 111, frame is "<TAB><STX><BEF>01234567<AFT><ETX><CR><LF>".

4.2. SERIAL INPUT

Prox'N'Roll RFID Scanner in **Serial mode** accepts short commands from the host, typically to drive its LEDs and buzzer.

Prox'N'Roll RFID Scanner doesn't echo back the received data.

If the received command has been understood by **Prox'N'Roll RFID Scanner**, it replies with an <ACK> byte before executing the requested action.

Otherwise, it replies with a <NACK> byte.

Command transmission format is <command> <CR> <LF>.

PROX'N'ROLL RFID SCANNER - Reference manual

4.2.1. List of commands

Command	Action
A0	Reader goes inactive (tag polling is halted)
A1	Reader goes active
R0	Switch red LED off
R1	Switch red LED on
R2	Red LED blinks slowly
R3	Red LED blinks quickly
G0	Switch green LED off
G1	Switch green LED on
G2	Green LED blinks slowly
G3	Green LED blinks quickly
Z0	Stop buzzer
Z1	Start buzzer
Z2	Short buzzer sound
Z3	Long buzzer sound
Margz	Same as sending Aa + Rr + Gg + Zz
Mrg	Same as sending $Rr + Gg$
Marg	Same as sending $Aa + Rr + Gg$
RST	Reset the reader
VER	Retrieve reader's version
SHO	Retrieve reader's settings

Choose appropriate configuration in CLD and CBZ before using the LEDs or buzzer related commands.

5. CONFIGURING PROX'N'ROLL RFID SCANNER

There are two ways to configure Prox'N'Roll RFID Scanner:

- Using a Master Card, formatted with cfgfilecreator.exe software. See chapters 6 and 7 for details. In Keyboard mode, when the Master Card has been processed the reader, it sends its firmware version (in the keyboard emulation stream), then restarts.
- Manually, by entering configuration values in reader's console (serial line access), as shown in this chapter. Only available for Prox'N'Roll RFID Scanner in Serial mode.

Default factory settings for **Prox'N'Roll RFID Scanner** firmware are :

- Keyboard mode,
- Reads any kind of ID, 8 byte fixed length output.

5.1. CONNECTING PROX'N'ROLL TO A COMPUTER

5.1.1. Activating serial mode

Activate the **Serial mode** using a Master Card configured to modify the OPT attribute. See chapters 2.2.1 for details.

5.1.2. Connection information

Install software ref. **SDD100** "USB Driver for SpringCard's FTDI-based devices" to see the interface as a virtual serial port (VCP).

Use HyperTerminal or any compliant terminal emulator to get connected onto the reader through the serial port. Default communication settings are :

- 8 data bits, 1 stop, no parity, no flow control;
- Baudrate = 38400bps.

5.1.3. Testing connection

- Power-up (or reset) the reader,
- Reader sends its identification string :

SpringCard Prox'N'Roll RFID Scanner 1.28

5.2. RETRIEVING PROX'N'ROLL RFID SCANNER INFORMATION

5.2.1. Firmware version

Enter "ver" to read **Prox'N'Roll RFID Scanner** firmware version.

5.2.2. Firmware configuration

Enter "sho" to read **Prox'N'Roll RFID Scanner** configuration.

5.3. Enabling configuration commands

Prox'N'Roll RFID Scanner configuration may be protected by a pin-code (if PIN configuration tag is empty, no pin-code is needed.

If defined to hFFFF, configuration commands are permanently disabled).

Enter "pinNNNN" to allow configuration commands, where NNNN is the actual pin-code (for instance, "pin1234") 25 .

5.4. Accessing Prox'N'Roll configuration

5.4.1. Reading configuration tags

Enter "cfg" to list all configuration tags.

Enter "cfgXX" to read value configuration tag XX (hexadecimal address).

Note that configuration tags $_h55$, $_h56$ and $_h6F$ (keys used by Master Cards and pin-code) are masked when read back.

5.4.2. Writing configuration tags

Enter "cfgXX=YYYY" to update configuration tag XX (hexadecimal address) with value YYYY (hexadecimal value).

Enter "cfgXX=!!" to delete configuration tag XX (hexadecimal address).

5.4.3. Writing keys in RC's secure EEPROM

Enter "keya0=XXXXXXXXXXXXX" to update key A at index 0, "keya1=..." to update key A at index 1, and so on until "keyaf=...".

Enter "keyb0=XXXXXXXXXXXXX" to update key B at index 0, "keyb1=..." to update key B at index 1, and so on until "keybf=...".

²⁵ For security reasons, configuration commands are enabled only for 3 minutes. After 3 minutes of inactivity, you'll have to enter the pin-code again.

Note that keys stored in RC can't be read back.

5.4.4. Reading RC's 4-byte EEPROM

RC's chipset includes a 4-byte EEPROM to store a configuration value.

Enter "cfgRC" to read this 4-byte value.

5.4.5. Writing RC's 4-byte EEPROM

RC's chipset includes a 4-byte EEPROM to store a configuration value.

Enter "cfgRC=XXXXXXXX" to write this 4-byte value.

Content of RC's 4-byte EEPROM is currently not used by **Prox'N'Roll RFID Scanner** firmware.

Please keep this value to 00000000 as it may be used in future versions.

5.5. Applying New Configuration

New configuration is applied only after reset.

Cycle power or enter "rst" to reset the reader.

5.6. REVERTING TO DEFAULT

Sometimes it is necessary to put reader back in "out-of-factory" configuration (for instance when reader goes from one site to another). This is done easily by erasing all tags from reader's memory.

Enter "cfg!!=!!" to delete all configuration tags.

There's no confirmation prompt nor any kind of "are you sure?" popup window. Erasing everything is immediate and unrecoverable.

Erasing all the configuration tags is not really enough to put the reader(s) back in out-of-factory configuration, since Mifare keys stored in RC's secure EEPROM are not erased.

Read paragraph 3.5.3 to see how the keys may be overwritten.

6. Working with Master Cards

6.1. OVERVIEW

Master Cards for **SpringCard RFID Scanners** are NXP Desfire 4k (MF3ICD40 or MF3ICD41). You may buy them from **SpringCard** or any other NXP reseller.

SpringCard SQ844P is a software package featuring :

- A command line utility, that creates the Master Cards from a Master Configuration File, and using a SpringCard contactless reader/writer²⁶
- A wizard (HTML page) that helps authoring the Master Configuration File.

SpringCard SQ844P also includes various configuration files, that show typical configuration for Prox'N'Roll RFID Scanner, IWM-K632, FunkyGate, RDR-K632, ProxRunner, etc.

SpringCard SQ844P is available only for Microsoft Windows systems.

a. Downloading and installing

Go to **www.springcard.com/download/sdks.html** and download latest version of package **sq884p**.

Double-click the downloaded file to launch the installer, and follow the wizard.

b. The cfgfilecreator.exe command line utility

cfgfilecreator.exe is a Windows command line software.

Enter **cfgfilecreator.exe** -h to read the complete list of command line switches and options, and the complete list of sections and variables for configuration files.

cfgfilecreator.exe software comes with various sample configuration files that show typical configurations of IWM-K632, FunkyGate, Prox'N'Roll RFID Scanner, etc.

²⁶ **SpringCard Prox'N'Roll PC/SC** (or Legacy) typically. CSB4 or any product in the CSB6 family may be used to create Master Cards too.

c. The cfgfilecreator.exe web page

cfgfilecreator.html is a standalone web page that helps creating configuration files for **cfgfilecreator.exe** .

6.2. Configuration files

cfgfilecreator.exe uses a configuration file to retrieve configuration data to be written into the Master Card.

Configuration files are written like standard Windows "INI" files. They can be created using Notepad or any other text editor, or using **cfgfilecreator.html**.

Each line of each section uses the format "name=value" where "name" is either the name or the tag of the configuration variable (e.g. either "opt" or "60"), and "value" its value in hexadecimal.

6.2.1. The "general" section

This section maps to tags h60 to h6F. Default content is:

[general]				
opt=0C	,	value	for	OPT
od1=02	-	value	for	ODL
rdl=0A	-	value	for	RDF
cld=0F	;	value	for	CLD
cbz=13	,	value	for	CBZ
wgd=0A	-	value	for	WGD
dtc=0A	;	value	for	DTC

ser=C5 ; value for SER shd=00 ; value for SHD pin=0000 ; value for PIN

6.2.2. The "rckeys" section

This section holds the Mifare access keys to be written in RC's secure EEPROM.

Type A keys are named "a0" to "a15", and type B keys "b0" to "b15".

Here's an example of content:

This section (and each line in it) is optional. Only keys listed in this section will be written, other keys will be left unchanged.

6.2.3. Sections for Card Processing Templates

SpringCard RFID Scanners run 1 to 4 card accepting templates.

Each template is configured by sections "tpl1", "tpl2", "tpl3" and "tpl4" respectively.

Mandatory and optional content for each section depends on the card lookup list (LKL field) of the section itself.

a. ID-Only example

This sample section configures template 4 to read any kind of ID. Output format is: 8-byte fixed length, prefixed by the string "ID=":

b. Desfire example

This sample section configures template 1 to read 8 bytes of data from a Desfire card. Output format is: 8-byte fixed length, no prefix:

PROX'N'ROLL RFID SCANNER - Reference manual

aut=00 A0A1A2A3A4A5A7 ; authentication with key 0, plain comm. ; mode, no diversification. Key is a single ; DES key (8 bytes)

6.2.4. Master Cards related sections

a. Specifying a new configuration for future Master Cards

The "tpl5" section allows to update the card processing template reserved to Master Cards. See paragraph 6.4.1 for details.

```
[tpl5] aut=E0 xx...xx ; 16-byte authentication key
```

This 16-byte authentication key in the "tpl5" section is the one that will be written in the reader(s) by the Master Card.

It is not the key that will be used to create the Master Card itself.

b. Specifying configuration to be used by current Master Card

The "master" section defines how the Master Card shall be created. See paragraph 6.4.2 for details.

```
[master]
aut=E0 xx...xx ; 16-byte authentication key
```

This 16-byte authentication key in the "master" section is the one that will be used to create the Master Card.

It has no impact on the key written in the reader(s).

6.3. OPERATION INSTRUCTIONS

- Open Configuration files creator (cfgfilecreator.html) (on Windows : Start Menu → All Programs → SpringCard → Configuration Tools),
- Create your configuration file and save it in the directory where cfgfilecreator.exe is installed, for instance with the name siteconf.ini (on Windows: C:\Program Files\SpringCard\SQ844P),
- Open Configuration tools directory (on Windows : Start Menu → All Programs → SpringCard → Configuration Tools),
- Plug and power-on your Prox'N'Roll PC/SC (or legacy),
- Put a virgin Desfire card on the Prox'N'Roll PC/SC (or legacy),
- Enter cfgfilecreator.exe -c siteconf.ini,
- Wait until Master Card is written.

If the Desfire card is not virgin, the **software will try to format it** (i.e. erase the whole file structure with all the data) **without prior notification**.

Be sure to put on the reader only a virgin card, or an old Master Card to be overwritten.

You've been warned...

6.4. Changing authentication key for Master Cards

All **SpringCard** products ship with the same out-of-factory authentication key. To secure their site, customers should replace the default key by their own key before installing the readers.

SpringCard recommends to make (and keep) at least two distinct Master Cards for each customer or site :

- 1st level Master Card alters only the authentication key (replace default key by site specific key).
 - \circ All readers bought for this site shall be configured using this 1^{st} level Master Card as soon as they are received.
- **2**nd level Master Card actually configures the reader (card processing templates, output mode and format, and so on).
 - It uses the site specific key for authentication, but doesn't update the key that is already inside the reader.
 - The 2nd level Master Card shall be used during installation and whenever you wish to change reader configuration.

Note that more than one 2^{nd} level Master Cards can be created (one for each kind of output settings, one for each people in charge of installation...) whereas only one 1^{st} level Master Card should be created and be kept in a secure place²⁷.

Be sure to remember the new authentication key you put in a reader. If you forget the authentication key, and forget the pin-code (or define pin-code to $_h FFFF$), it will be impossible to change reader configuration again !

You've been warned...

6.4.1. Creating a first level Master Card

Create a configuration file (say, "master.ini") with only those 4 lines :

```
[master]
; Master section is empty, we use SpringCard's default keys
[tpl5]
aut=E0 xx...xx
```

where xx...xx is the site specific 16-byte authentication key²⁸,

- Put a virgin card on the Prox'N'Roll, label it "1st level Master Card",
- Enter cfgfilecreator.exe -c master.ini ,
- Use this Master Card to write the new authentication key in the reader(s).

6.4.2. Creating a second level Master Card

- Create a complete configuration file as seen earlier.
- Terminate the file with those 4 lines :

```
[master]
aut=E0 xx...xx
[tpl5]
; Template 5 section is empty, we keep current keys in the reader
```

where xx...xx is the site specific 16-byte authentication key,

- Put a virgin card on the Prox'N'Roll, label it "2nd level Master Card",
- Enter cfgfilecreator.exe -c siteconf.ini ,
- Use this Master Card to write complete configuration in the reader(s).

 $^{^{27}}$ That's because 1^{st} level Master Card has got the authentication key written in it, and anybody may retrieve it using **cfgfilecreator** software, as the authentication key is only used to secure 2^{nd} level Master Cards and is not written in them.

 $^{^{28}}$ This is key 0 inside Master Card application; the key will be diversified using HMAC-MD5 algorithm, so the "E0" header is mandatory.

6.5. REVERTING TO DEFAULT

Sometimes it is necessary to put reader back in "out-of-factory" configuration (for instance when reader goes from one site to another). This is done easily by erasing all tags from reader's memory.

■ Create a configuration file (say, "factory.ini") with only those 3 lines :

```
[master]
aut=E0 xx...xx
clear=1
```

where xx...xx is the site specific 16-byte authentication key

- Put a virgin card on the Prox'N'Roll, label it "Erase all Master Card",
- Enter cfgfilecreator.exe -c factory.ini
- Use this Master Card to put the reader(s) back in out-of-factory configuration.

Erasing all the configuration tags is not really sufficient to put the reader(s) back in out-of-factory configuration, since Mifare keys stored in RC's secure EEPROM are not erased.

Just add an "rckeys" section, with dummy keys, to overwrite those keys.

7. Specification of Master Cards

This chapter is provided as a mean for security experts to evaluate the Master Card architecture of **SpringCard RFID Scanners**.

Customers do not need to implement this part themselves, since **cfgfilecreator.exe** software is a convenient tool to create Master Cards. See chapter 6 for details.

7.1. BUILDING A MASTER CARD

- The Master Card must be a Desfire 4k,
- The reader tries to fetch configuration data from Desfire cards according to the Master Card template specified in next paragraph. Data are protected by an authentication key that may be changed on a per-customer or per-site basis (i.e. Master Cards belonging to customer X will not work on customer Y's readers),
- Before storing new settings in its non-volatile memory, the reader checks that data comes with a valid digital signature. The signing key can't be changed, and is only known by **SpringCard**'s software. This ensure that only data that has been pre-validated by a genuine software can be loaded in reader's non-volatile memory.

7.2. TEMPLATE FOR MASTER CARDS

7.2.1. Location of data

Name	Tag	Description	Size
LOC.MAS	_h 53	Location of data in master cards. See table a below.	5

a. Data location bytes

Offset	Length	Content	Specified value
0	3	Application IDentifier (AID).	_h 504143
3	1	File IDentifier (FID) for configuration data.	_h 01
4	1	File IDentifier (FID) for digital signature.	_h 02

7.2.2. Authentication key

Out-of-factory key used for authentication of Master Cards is confidential.

Only **SpringCard** genuine software –such as **cfgfilecreator.exe**– is able to create Master Cards with the default authentication key.

To secure their installation, customers should replace this key as soon as they receive the readers, as explained in 6.4.

This is the same structure as AUT.DFR.

Name	Tag	Description	Size
AUT.MAS	_h 55	Authentication key. See table a below.	17

a. Authentication key bytes

Offset	Length	Content
0	1	Authentication key index and options. See table b below.
1	16	Authentication key for Master Cards (this is 3-DES key).

b. Authentication key index and options

Bit	Value	Meaning
		Communication mode in read operation
7 – 6	00	Plain
	01	MACed with session key
	10	RFU
	11	Enciphered with session key
		Key diversification algorithm
5 – 4	00	Use the key "as is"
	01	Diversify the key using Desfire SAM algorithm
	10	Diversify the key using HMAC-MD5 algorithm
	11	RFU
		Index of key in Desfire application
3 – 0	0000	
	to	Index of the key to be used for authentication
	1110	
	1111	RFU

Specified value: hE0 (key 0, HMAC-MD5 diversification, ciphered reading)

7.2.3. Signing key

Name	Tag	Description	Size
SGN.MAS	_h 56	Signing key. See table a below.	17

Key used for digital signature of master cards is confidential.

Only **SpringCard** genuine software –such as **cfgfilecreator.exe**– is able to sign the Master Cards²⁹.

Customers shall not try to change this parameter, unless advised to by **SpringCard**.

a. Signing key bytes

Of	fset	Length	Content
0		1	Index and options. See table b below.
1		16	Key data (this is 128-bits key).

b. Signing key index and options

Bit	Value	Meaning
7 – 6	00	Those bits are RFU and must be 00
		Key diversification algorithm
5 – 4	00	Use the key "as is"
	01	Diversify the key using Desfire SAM algorithm
	10	Diversify the key using HMAC-MD5 algorithm
	11	RFU
3 – 0	0000	Those bits are RFU and must be 00

Specified value: h20 (HMAC-MD5 diversification)

7.3. DATA STRUCTURE

7.3.1. Size of file

File holding configuration data and Mifare keys (offset 3 in LOC.MAS) must be exactly 512-byte long. In case used size is shorter than 512 bytes, file must be padded with $_{\rm h}00$.

7.3.2. Configuration data

The configuration data block uses the T,L,V (tag, length, value) encoding scheme.

- Tag is 1 byte-wide,
- Len is 1 byte-wide,
- Value is 0 to 24 byte-wide.

²⁹ This choice has been done to ensure that data inside the Master Card have been pre-validated according to reader specifications, and have not been corrupted afterwards.

PROX'N'ROLL RFID SCANNER - Reference manual

Items found in T,L,V blocks will overwrite data with the same tag already present in reader's non-volatile memory.

Set Len = 0 to delete an existing tag from the non-volatile memory, without replacing it.

Last T,L,V of the configuration data block must be the (valid) signature of the whole block, according to the HMAC-MD5 digital signature algorithm specified in next chapter.

7.3.3. Mifare keys to be loaded into RC's secure EEPROM

Keys to be loaded into RC's secure EEPROM use the T,L,V scheme, as follow:

- Tag (1 byte) = h80 + key index (see chapter "Mifare Classic Card Acceptance Template"),
- Len (1 byte) = $_{h}06$,
- Value is the Mifare key (6 bytes exactly).

7.4. DIGITAL SIGNATURE

7.4.1. Size of file

File holding the signature (offset 4 in LOC.MAS) must be exactly 16-byte long.

7.4.2. Algorithm

This is the signature algorithm when default parameters in SGN.KEY are used:

- Let Content be the 512-byte configuration block as written in the card³⁰,
- Let SignKey be the 16-byte key,
- Diversify SignKey from card's UID, using HMAC-MD5 diversification algorithm³¹ to get DivKey,
- Compute Sign = HMAC-MD5 (Block) using DivKey ³².

The value of *SignKey* is confidential. Customers shall not try to change the key, nor the signature algorithm.

 $^{^{30}}$ This is the configuration data plus the Mifare keys to be loaded into RC's secure EEPROM. Total size is up to 512 bytes. Note that signature is computed over the whole file, including its padding, whatever the used length is.

³¹ See next chapter "Security algorithms"

³² See next chapter "Security algorithms"

8. SECURITY ALGORITHMS

8.1. HMAC SIGNATURE AND KEY DIVERSIFICATION

8.1.1. Abstracts

A message authentication code, or MAC, is a short piece of information used to authenticate a message. A MAC algorithm accepts as input a secret key and a message, and outputs a MAC that protects both message's integrity and authenticity.

An HMAC (or keyed-hash message authentication code) is a type of MAC function were a cryptographic hash function is used to compute the output.

a. HMAC algorithm

$$\mathrm{HMAC}_K(m) = h \bigg((K \oplus \mathrm{opad}) \| h \Big((K \oplus \mathrm{ipad}) \| m \Big) \bigg),$$

Where h is the hash function, K is the secret key padded with extra zeros up to 64 bytes, m is the message to be authenticated. opad is the value $_h5C$ repeated 64 times, and ipad the value $_h36$ repeated 64 times.

b. HMAC-MD5

HMAC-MD5 is a particular HMAC function where h is the MD5 standard function, as defined by RSA laboratories. Size of HMAC is 16 bytes exactly.

In the **SpringCard RFID Scanners** family, we use HMAC-MD5 for both signature and key diversification.

8.1.2. HMAC-MD5 for digital signature

HMAC protects both message's integrity and authenticity, so it can be considered as a digital signature³³.

IWM implementation allows only 16-byte keys. The key can be used "as is" or be the result of a diversification from a master key.

8.1.3. HMAC-MD5 for key diversification

In this particular mode, we name K the "master key" and we compute the HMAC over card's identifier to establish a "diversified key" Ku.

³³ Literature often reserve the name "digital signature" to public key schemes, where verifier doesn't need to know signer's private key to verify the signature. HMAC is a scheme where signer and verifier must share the same secret key.

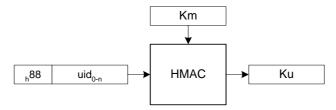

a. DES or Triple-DES key diversification

The algorithm takes as inputs:

- A 16-byte master key (Km)
- The card serial number (uid)³⁴

It provides as output:

The 16-byte diversified key specific to this card (Ku).

The diversified key can now be used either for Desfire authentication, or for HMAC-MD5 signature.

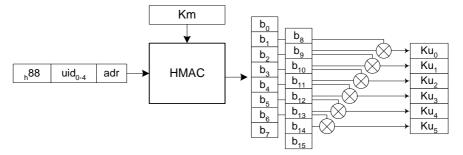

b. Mifare key diversification

The algorithm takes as inputs:

- A 16-byte master key (Km)
- The 4-byte card serial number (uid)
- The 1-byte block address (adr)

It provides as output:

The 6-byte Mifare key specific to the couple card + address (Ku).

Note: the *adr* parameter is the either the <u>sector number</u> (not the block) number) or fixed to $_{\rm h}00$, depending on the configuration in the Mifare Classic Card Acceptance Template.

 $^{^{34}}$ The UID is 7-byte long for a Desfire card, 4-byte long for a Mifare card. The same diversification algorithm is usable whatever the length is.

8.2. DESFIRE SAM / RC171 KEY DIVERSIFICATION

8.2.1. DES or Triple DES key diversification

The key diversification algorithm described here is the one provided by Desfire SAM. Please refer to the corresponding datasheet for details.

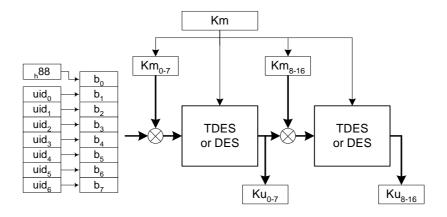

The algorithm takes as inputs:

- A 16-byte Triple-DES master key (Km)³⁵
- The 7-byte card serial number (uid)

It provides as output:

The 16-byte diversified key specific to this card (Ku).

Here's the flowchart:

The diversified key now be used for Desfire authentication.

8.2.2. Mifare key diversification

The Mifare diversification algorithm described here is provided both by Desfire SAM and by NXP RC171 coprocessor. Please refer to the corresponding datasheets for details.

a. Basis

The algorithm takes as inputs:

- A 6-byte master key (Km)
- A 16-byte Triple-DES diversification key (Kd)³⁶

³⁵ If both halves are equals, the key maps to a single DES key

³⁶ If both halves are equals, the key maps to a single DES key

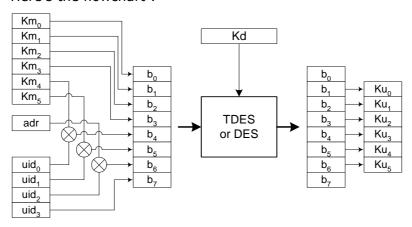

- The 1-byte block address (adr)
- The 4-byte card serial number (uid)

It provides as output:

■ The 6-byte Mifare key specific to the couple card + address (Ku).

Here's the flowchart:

b. Diversification based on UID only

If this option is selected, the adr input parameter is fixed to ${}_{\rm h}00$ whatever the block to be read is.

c. Diversification based on UID and address

If this option is selected, the *adr* input parameter is the Mifare <u>sector number</u> (not the block).

Here's an example with a Mifare 1k card:

- Data is located on block 29,
- Block 29 belongs to sector 7 (29 / 4),
- The diversification algorithm will be fed with adr = 7.

Here's an example with a Mifare 4k card:

- Data is located on block 231,
- Block 231 belongs to sector 38 (32 + (231-128) / 16),
- The diversification algorithm will be fed with adr = 38.
