This document covers all versions of IWMK632 and IWMK632 Mk2. Although we try to keep new releases compliant with earlier ones, there have been a few changes introduced by firmware release 1.20.

Those changes are reflected by this document going from version BB to version CA.

In case your IWMK632 or IWMK632 Mk2 has a firmware release in one of the 1.0x or 1.1x families, please either

- Upgrade your reader with an up-to-date firmware, or
- Refer to earlier version of this document : PMAA061-BB

1. INTRODUCTION

This document provides detailed technical information for use of the **SpringCard** wall-mount contactless proximity card reader **IWM-K632**.

1.1. AUDIENCE

This reference manual assumes that the reader has expert knowledge of electronics. It is designed to be used by system integrators.

1.2. PRODUCT BRIEF

a. Abstract

IWM-K632 is a wall-mount proximity reader. It reads serial number or data from any standard ISO/IEC 14443 contactless card, including popular NXP MIFARE and DESFire families, and also ISO/IEC 15693 vicinity tags used in RFID systems.

IWM-K632 belongs to the **SpringCard RFID Scanners** family, which means that most characteristics of this products are shared with others products (especially the configuration attributes and methods). This makes it easy to use various products (for instance, a wall-mounted reader and an USB PC-connected reader) sharing a common configuration to read the same cards.

b. Typical applications

This reader is primarily dedicated to corporate access control, where a high level of security or versatility is needed, but can also be used in cash or vending machines.

c. Output modes

Depending on software configuration (stored in non-volatile memory), the same reader can be operated into 3 modes :

- Wiegand (output only), with configurable frame length,
- Dataclock or ISO2 / Magstripe (output only),
- Serial input/output.

Depending on the underlying hardware, the serial input/output can either be RS-232, RS-485, or USB (USB to serial bridge).

d. On the field configuration

IWM-K632 is fully configurable on-the-field through secured Master Cards. Internal MD5, DES and 3-DES cryptographic algorithms are available for advanced security operations.

1.3. PRODUCT VERSION WARNING

At the date of writing, there are 2 generations of **IWM-K632** :

- First generation (label **IWM-K632**) has been discontinued in February 2008
- Second generation (label **IWM-K632 Mk2**) is currently in production

Both generations are 100% software compatible, but **there are a few difference in hardware**. This document depicts clearly those difference.

Each generation has 2 distinct products :

- **IWM-K632-WD** or **IWM-K632-WD Mk2** :
reader with Wiegand / Dataclock / RS-485 outputs
- **IWM-K632-SU** or **IWM-K632-SU Mk2** :
reader with RS-232 / USB outputs

Starting with IWMK632 firmware release 1.20, handling of non-standard cards in the ISO 14443-B family (ASK CTS256B and CTS512B, ST MicroElectronics SR176 and compliand, Inside Contactless PicoTag) has changed.

Do not try to use IWMK632 firmware 1.11 and earlier with those cards.

1.4. RELATED DOCUMENTS

You'll find any details regarding hardware and physical characteristics of each reader in the corresponding datasheet.

Datasheet	Covered products
PFL800P	IWM-K632-WD
PFL80PP	IWM-K632-SU
PFT874P	IWM-K632-WD (and IWM-K531-WD)
PFT875P	IWM-K632-SU (and IWM-K531-SU)

2. CONFIGURATION ATTRIBUTES

There are two families of configuration attributes :

- Product specific Global Configuration Attributes,
- Card Acceptance Templates.

The Card Acceptance Templates are common to all products in the **SpringCard RFID Scanner family**, and are exposed in detail in the next chapter.

In this chapter, we'll introduce configuration tags and detail the **IWM-K632's** specific configuration attributes.

2.1. PRINCIPLES

a. Configuration tags

Each configuration attribute is recognized by its "tag" and its length. The tag is a one-byte value, that uniquely identifies the attribute.

The list of available tags, and their meaning, is the purpose of this chapter and the next one.

Unless specified, each configuration attribute is exactly one byte (8 bits) long.

b. Non-volatile memory endurance

IWM-K632 configuration attributes are stored in reader's non-volatile memory (flash). They can be changed up to 100 times.

Changing any configuration attribute more than 100 times may permanently damage your **IWM-K632** reader.

2.2. GLOBAL CONFIGURATION ATTRIBUTES

2.2.1. General options

Name	Tag	Description	Size
OPT	_h 60	General options. See table a below.	1

a. General options bits

Bit	Value	Meaning
7	0	Normal mode
	1	Power saving mode ¹
6	0	Shutdown RF field when idle
	1	Shutdown RF field only when no card detected ²
5 – 4	00	Anti-collision model : Process every card one after the other
	01	<i>RFU</i>
	10	When 2 cards are in the field, process the 1 st and ignore the 2 nd
	11	When 2 cards are in the field, ignore both
3 – 2	00	Master Card : Master Cards are disabled ³
	01	Master Cards are enabled at power up
	10	<i>RFU</i>
	11	Master Cards are enabled all the time
1 – 0	00	Output interface : serial duplex (RS-232, USB) reader ⁴
	01	serial half-duplex (RS-485) reader ⁴
	10	Wiegand reader ⁵
	11	Dataclock reader ⁵

Default value : _b10001101

(power saving mode, Master Cards are enabled all the time, RS-485)

¹ When this value is selected, the card detection loop runs only every 250ms. In the meantime, RC chipset is OFF to reduce average power consumption. Do not choose this mode if you need fast operation at the gates, since it will increase transaction time at least by 250ms.

² This is required if strict anti-collision (bits 5-4 = _b10 or _b11) is needed.

³ Configuration settings can only be altered through serial link

⁴ Actual RS-232, RS-422, RS-TTL or USB compliance depends on hardware (WD or SU).

⁵ Available only on WD hardware.

2.2.2. Delays and repeat options

Name	Tag	Description	Min	Max
ODL	_h 61	Min. delay between 2 consecutive outputs (0.1s).	0	100
RDL	_h 62	Min. delay between 2 consecutive <u>identical</u> outputs (0.1s). A value of 255 means that the card must be removed from the field –and re-inserted into– before being read again.	0	100

Default value : ODL = 2 (200ms) RDL = 10 (1s)

2.2.3. LED and buzzer control options

Name	Tag	Description	Size
CLD	_h 63	LEDs control. See table a below.	1
CBZ	_h 64	Buzzer control. See table b below.	1

a. LEDs control bits

Bit	Value	Meaning
7	0	Short LED sequences (3 seconds)
	1	Long LED sequences (10 seconds)
6	0	No detection of host controller
	1	Both LEDs flash until host controller is detected ⁶
5	0	When idle, red LED blinks slowly ("heart beat" sequence)
	1	When idle, red LED is off
4	0	No action on green LED before specified by host controller
	1	Green LED blinks when a valid card has been processed
3	0	No action on red LED for unsupported cards
	1	Red LED blinks when an unsupported card has been processed
2	0	No action on green LED before processing is achieved
	1	Green LED blinks as soon as a card is seen in the field
1 – 0	00	LED control by hardware lines, other settings are ignored ⁷
	01	LED control by serial commands, other settings are ignored ^{6 & 8}
	10	<i>RFU</i>
	11	LED control by internal software and serial commands ^{6 & 8}

Default value : _b00001111

⁶ Valid for serial modes only (RS-232, RS-485, USB)

⁷ Jumper(s) must be set to enable LED input, see § 4.1

⁸ Jumper(s) must be set to disable LED input, see § 4.1

b. Buzzer control bits⁹

Bit	Value	Meaning
7	0	Buzzer short pulse = 0,2 sec
	1	Buzzer short pulse = 0,5 sec
6	0	Buzzer long pulse = 0,7 sec
	1	Buzzer long pulse = 1,5 sec
5		<i>RFU</i>
4	0	No action on buzzer before specified by host controller
	1	Short pulse when a valid card has been processed
3	0	No action on buzzer for unsupported cards
	1	Long pulse when an unsupported card has been processed
2	0	No action on buzzer before processing is achieved
	1	Short pulse as soon as a card is seen in the field
1 – 0	00	Buzzer is disabled, other settings are ignored
	01	Buzzer controlled by serial commands, other settings are ignored
	10	<i>RFU</i>
	11	Buzzer controlled by internal software and serial commands

Default value : `b00010011`

⁹ Set jumper 4 to ON to allow buzzer control. If jumper 4 is OFF, buzzer is totally disabled.

2.3. OUTPUT MODE

2.3.1. Wiegand mode

Name	Tag	Description	Size
WGD	h_{65}	Wiegand configuration bits. See table a below.	1

a. Wiegand configuration bits

Bit	Value	Meaning
7 – 4	0000	Wiegand output options "as is" (no parity, no LRC)
	0001	RFU
	0010	RFU
	0011	RFU
	0100	RFU
	0101	RFU
	0110	RFU
	0111	RFU
	1000	RFU
	1001	RFU
	1010	RFU
	1011	RFU
	1100	Add 2+1 parity bits
	1101	RFU
	1110	RFU
1111	RFU	
3 – 2	00	Wiegand timings : guard time guard time = 250µs
	01	guard time = 1000µs
	10	guard time = 1500µs
	11	guard time = 3000µs
1 – 0	00	Wiegand timings : pulse time pulse time = 25µs
	01	pulse time = 50µs
	10	pulse time = 100µs
	11	pulse time = 200µs

Default value : $b_{00001010}$

See chapter 6 for details on using the reader in Wiegand mode.

2.3.2. Dataclock mode

Name	Tag	Description	Size
DTC	$_{h}66$	Dataclock configuration bits. See table a below.	1

a. Dataclock configuration bits

Bit	Value	Meaning
7	0	Standard ISO2 / Magstripe frame ¹⁰
	1	Raw output (bits 3-2 are ignored) ¹¹
6 – 4		<i>RFU</i>
3 – 2	00	Dataclock output options Non-decimal digits in the output frame are discarded
	01	Non decimal digits in the output frame are replaced by separators
	10	Dataclock translation method 1
	11	Dataclock translation method 2
1 – 0	00	Dataclock timing clock pulse = 100µs
	01	clock pulse = 200µs
	10	clock pulse = 330µs
	11	clock pulse = 500µs

Default value : $_{b}00000010$

See chapter 7 for details on using the reader in Dataclock mode.

¹⁰ Frame starts with 0xB, ends with 0xF + 4 bits LRC. Only decimal digits can be transmitted as 4-bit nibbles. A parity bit is transmitted with each nibble.

¹¹ No frame marker, no LRC, no parity bits.

2.3.3. Serial mode (RS-485, RS-232, USB)

Name	Tag	Description	Size
SER	_h 67	Serial configuration bits. See table a below.	1

a. Serial configuration bits

Bit	Value	Meaning
7	0	No STX / ETX frame markers
	1	Use STX and ETX as frame markers
6 – 5	00	No BEL / TAB / CR/LF frame markers
	01	Use CR/LF only
	10	Use BEL and CR/LF as frame markers
	11	Use TAB and CR/LF as frame markers
4 – 3		Serial Repeat
	00	No repeat
	01	Repeat 4 times with timeout of 100ms
	10	Repeat 4 times with timeout of 250ms
2 – 0		Baudrate
	000	1200bps
	001	2400bps
	010	4800bps
	011	9600bps
	100	19200bps
	101	38400bps
110	RFU	
111	115200bps	

Default value : _b11000101

The baudrate parameter is common to USB, RS-232 and RS-485 interfaces. Even if it is allowed, do not set baudrate to 115200bps when working with RS-485 interface, as the hardware and the characteristics of the bus aren't able to support it.

b. Serial frame format

Serial frames are always transmitted using ASCII representation of binary values.

For example, data '00 7A 12 6C 59 F4 04' (hexadecimal notation) is transmitted as string "007A126C59F404".

c. Serial frame markers

Bits 7-5 drive the start of frame / end of frame markers.

See chapter 5 for details on using the reader in Serial mode.

2.3.4. RS-485 mode

Name	Tag	Description	Size
SHD	$_{h}68$	RS-485 configuration bits. See table a below.	1

a. RS-485 configuration bits

Bit	Value	Meaning
7 – 4		RFU
3 – 0	0000	Addressing disabled (single device on bus)
	0001 to 1110	Address = $_{h}01$ ($_{d}1$) to address = $_{h}0E$ ($_{d}14$)
	1111	RFU

2.3.5. Keep-alive

When the reader is running in serial mode (RS-232 or RS-485), it may send keep-alive frames periodically to the target host.

This allow the host to make sure the reader is still connected.

Name	Tag	Description	Size
KAL	$_{h}69$	Keep-alive configuration. See table a below. Default value : $_{h}00$	1 to 4

a. Keep-alive configuration bits

Offset	Length	Content
0	1	Keep-alive configuration bits. See table b below
1	0 to 3	Value of constant frame for keep-alive.

b. Keep-alive options

Bit	Value	Meaning
7 – 5		RFU
4	0	Send an empty frame
	1	Send a constant frame – Value of constant frame starts at offset 1
3 – 0	0000	Keep-alive disabled
	0001 to 1111	Delay between 2 keep-alive frames. Minimum = $_{h}1$ (1s) to maximum = $_{h}F$ (15s)

2.4. OTHERS

2.4.1. PIN code

Name	Tag	Description	Size
PIN	$\text{h}6\text{F}$	PIN code to access reader's console.	2

Default value : empty (*no pin-code*)

Use this tag to define a 4 digits PIN code to protect access to reader's console.

The 2-byte value must store 4 valid BCD digits, or the reserved value hFFFF that permanently disables the console feature.

3. CARD ACCEPTANCE TEMPLATES

Products in the **SpringCard RFID Scanners** family are able to manage different types of cards, and different sources of data on each card.

A **Card Acceptance Template** defines how the reader will recognize the card to be read, and how it would get the actual data (serial number, block reading, file selection and reading, authentication keys to be used for Mifare or Desfire, etc).

The template also defines which formatting is to be applied to the data when sending them to the target device (translation to ASCII or to Decimal, constant prefix or suffix, etc).

This product is able to run up to 4 Card Acceptance Templates simultaneously.

3.1. BASIS

Each Card Acceptance Template is configured through a set of configuration attributes, each attribute having its own tag.

- Template 1 uses Configuration tags h_{10} to h_{1F}
- Template 2 uses Configuration tags h_{20} to h_{2F}
- Template 3 uses Configuration tags h_{30} to h_{3F}
- Template 4 uses Configuration tags h_{40} to h_{4F}

In the following pages, we use the convention "Template t uses Configuration tags h_{t0} to h_{tF} ". Replace t by the current template number.

3.1.1. Card lookup list

Name	Tag	Description	Size
LKL	h_t0	Card lookup list of the template. See table a below.	1

a. Available values for LKL

Value	Card(s) accepted by the template	Processing template	§
h_{01}	ISO/IEC 14443 type A (layer 3)	ID only	3.2
h_{02}	ISO/IEC 14443 type B (layer 3)		
h_{03}	ISO/IEC 14443 A&B (layer 3)		
h_{04}	ISO/IEC 15693		
h_{07}	ISO/IEC 14443 A&B and ISO/IEC 15693		
h_{08}	NXP ICODE1		
h_{0C}	NXP ICODE1 and ISO/IEC 15693		
h_{0F}	All of the above		
h_{11}	ISO/IEC 14443 type A (layer 4 / T=CL)	7816-4	3.6
h_{12}	ISO/IEC 14443 type B (layer 4 / T=CL)		
h_{13}	ISO/IEC 14443 A&B (layer 4 / T=CL)		
h_{22}	ST MicroElectronics SR family	ID only	3.2
h_{23}	ASK CTS256B and CTS512B		
h_{24}	Inside Contactless PicoTAG ¹²		
h_{61}	NXP Mifare Classic 1k & 4k	Mifare Classic	3.3
h_{62}	NXP Mifare UltraLight	Mifare UltraLight	3.4
h_{71}	NXP Desfire 4k	Desfire	3.5
h_{72}	Calypso (Innovatron protocol)	ID only or 7816-4	3.2 or 3.7
h_{FF}	All cards supported	ID only	3.2

Other values are *RFU*

The LKL tag is mandatory to enable a template group. If not found, the template group is empty.

¹² Also HID iClass

3.1.2. Summary of other tags in templates

Depending of the card lookup list (LKL tag), a specific list of tags controls the behaviour of the Processing Template.

The table below summarize this.

Tag	ID only	Mifare UltraLight	Mifare Classic	Desfire	7816-4	Calypso
_h t1	Output format					
_h t2	Output prefix					
_h t3	Offset	Location of data				
_h t4	Options			T=CL options		C. options
_h t5			Auth. method & key		1 st APDU	
_h t6			Sign. method & key		2 nd APDU	
_h t7					3 rd APDU	

Grey items are *RFU* and must be kept empty.

3.1.3. Important notice regarding template-ordering

Be careful that the 4 templates are processed one after the other. The loop is ended after the first successful match.

If a card matches two (or more) templates, it will be handled only by the first one.

Suppose you want to accept both a specific kind of 14443-B T=CL cards, with advanced file reading, and another kind of wired-logic 14443-B cards, where only the ID is significant. You must put the T=CL template *before* the ID template, otherwise the T=CL part will be skipped.

3.2. ID-ONLY ACCEPTANCE TEMPLATES

Use an ID-only Acceptance Templates when you want to read the serial number and/or the protocol-related constant bytes from a contactless card, or a group of contactless cards.

Depending on the settings you define in the Lookup List attribute (tag LKL.IDO), the reader may either

- Find any supported contactless card,
- Find only a specific family of contactless cards,
- Find ISO compliant contactless cards.

As you may have more than one ID-only Acceptance Template (up to 4 in fact), you may easily display different types of cards with a different format.

Including card's type in the returned ID is also an interesting option (see 3.2.6.b), as for instance there's no rule to prevent an ISO 14443-B card to have a different serial number than any ISO 14443-A ones.

3.2.1. Lookup list

Name	Tag	Description	Size
LKL.IDO	$_h t0$	ID-only lookup list : $_h 01 \leq \text{value} \leq _h 0F$ for ISO-compliant cards, $_h 21 \leq \text{value} \leq _h 2F$ for non-ISO cards, value = $_h FF$ all the supported cards. See 3.1.1.a for details.	1

3.2.2. Output format

Name	Tag	Description	Size
TOF.IDO	$\text{h}t1$	ID-only output format. See table a below.	1

a. Output format bits

Bit	Value	Meaning
7 – 6	00	Byte swapping Do not swap ID bytes (ID is transmitted “as is”)
	01	<i>RFU</i>
	10	Swap bytes for single-size (4 bytes) ISO 14443-A UIDs ¹³ only ; IDs of any other card is transmitted “as is”
	11	Swap ID bytes for all kind of cards
5	0	Padding Left-padding with $\text{h}0$
	1	Right-padding with $\text{h}F$
4	0	ISO 14443-B specific Use ISO 14443-B PUPI (4 bytes) as ID
	1	Use complete ISO 14443-B ATQ (11 bytes) as ID
3 – 0	0000	Output length Decimal, 4 bytes seen as 10 digits (i.e. 32 → 40 bits expansion)
	0001	Fixed length, 4 bytes ¹⁴
	0010	Fixed length, 8 bytes ¹⁵
	0011	Fixed length, 5 bytes
	0100	Fixed length, 12 bytes ¹⁶
	0101	Fixed length, 7 bytes ¹⁷
	0110	Fixed length, 11 bytes ¹⁸
	0111	<i>RFU</i>
	1000	Fixed length, 16 bytes
	1001	<i>RFU</i>
	1010	<i>RFU</i>
	1011	<i>RFU</i>
1100	Decimal, 5 bytes seen as 12 digits (i.e. 40 → 56 bits expansion)	
1101	Decimal, 5 bytes seen as 13 digits (i.e. 40 → 64 bits expansion)	
1110	Decimal, variable length (maximum 13 digits)	
1111	Variable length (depends on actual size of ID)	

Default value : $\text{b}10000010$

(8 bytes fixed length, left padding, swap bytes for short ISO 14443-A UIDs only)

¹³ This is the default format in NXP’s Mifare Classic related literature.

¹⁴ ISO 14443-A single-size UID, ISO 14443-B PUPI, serial number for ASK CTS256B and CTS512B.

¹⁵ ISO 15693 ID, serial number for NXP ICODE1, Inside Contactless PicoTag, ST MicroElectronics SR family...

¹⁶ ISO 14443-A triple-size UID.

¹⁷ ISO 14443-A double-size UID.

¹⁸ ISO 14443-B complete ATQB.

3.2.3. Output prefix

Name	Tag	Description	Size
PFX.IDO	$_h t_2$	ID-only output prefix.	Var.

Default value : absent (*no prefix*)

If a non-null ASCII value is specified (either a single character or a string), it will be transmitted before the data (therefore the actual length will be longer than the specified length).

3.2.4. Offset of data

Name	Tag	Description	Size
LOC.IDO	$_h t_3$	Offset in the ID.	1

Default value : $_b 00000000$ ($_d 0$)

When TOF.IDO specifies a fixed length output, using LOC.IDO makes it possible to select some bytes in the ID, and not only the first ones. This is principally useful when working with non-ISO cards, as shown in the following paragraphs.

3.2.5. Role of LOC.IDO with non-ISO cards

A few manufacturers still offer non standard cards, most of them based on ISO 14443-B bit-level specification, but with a proprietary frame format (protocol) and a proprietary command set.

As those cards don't answer to ISO 14443 standard detection commands, a specific template must be activated to discover them.

a. *ST MicroElectronics SR family*

When LKL.IDO= $h22$, the reader performs the lookup sequence for cards in the ST MicroElectronics SR family (SR176, SRX, SRIX).

A 8-byte serial number is returned by the card. Use TOF.IDO and LOC.IDO if you need to truncate it.

b. *ASK CTS256B and CTS512B*

When LKL.IDO= $h23$, the reader performs the lookup sequence for cards in the ASK CTS-B family (CTS256B, CTS512B).

A 8-byte identifier is built as follow :

Byte 0	Byte 1	Byte 2	Byte 3	Bytes 4 to 7
Manufacturing code	Product code	Embedded code	Application code	4-byte serial number

- CTS256B's product code is between $h50$ and $h5F$,
- CTS512B's product code is between $h60$ and $h6F$,
- See ASK's documentation for explanations regarding other bytes.

Define LOC.IDO= $h04$ (and TOF.IDO= $h01$) if you need only the serial number (and don't care for card type and other data).

c. *Inside Contactless PicoTAG¹⁹*

When LKL.IDO= $h24$, the reader performs the lookup sequence for cards in the Inside Contactless PicoTAG family (PicoTAG 16KS).

A 8-byte serial number is returned by the card. Use TOF.IDO and LOC.IDO if you need to truncate it.

¹⁹ Also HID iClass

3.2.6. Miscellaneous options

Name	Tag	Description	Size
OPT.IDO	$_h t4$	ID-only miscellaneous options. See table a below.	1

a. Miscellaneous option bits

Bit	Value	Meaning
7 – 4		<i>RFU</i>
3 – 2	00	Position of card's type in the output Card type is sent before the prefix ²⁰
	01	Card type is sent after the prefix and before the ID ²¹
	10	Card type is sent after the actual ID ²²
	11	<i>RFU</i>
1 – 0	00	Send card's type in the output Do not send card's type
	01	Send card's type on one byte (2 hex digits) (see table b below)
	10	Send card's type as a string (see table b below)
	11	<i>RFU</i>

Default value : $_b 00000000$

b. Values for card's type byte or string

When OPT.IDO is configured to send card's type in the output, the possible values are :

"Physical" card's type	One byte value	String value	Remark
ISO/IEC 14443 A	$_h 01$	" A "	Card must be compliant with Layer 3 or layer 4
ISO/IEC 14443 B	$_h 02$	" B "	
ISO/IEC 15693	$_h 04$	" V "	
NXP ICODE1	$_h 08$	" I "	
Inside Contactless PicoTAG	$_h 10$	" i "	Also HID iClass
ST MicroElectronics SR family	$_h 20$	" s "	
ASK CTS256B and CTS512B	$_h 40$	" a "	
Calypso (Innovatron protocol)	$_h 80$	" C "	

²⁰ The actual frame is <card type><PFX.IDO><card id> (PFX.IDO may be empty)

²¹ The actual frame is <PFX.IDO><card type><card id> (PFX.IDO may be empty)

²² The actual frame is <PFX.IDO><card id><card type> (PFX.IDO may be empty)

3.3. MIFARE CLASSIC ACCEPTANCE TEMPLATE

Mifare "Classic" refers to NXP Mifare 1k (MF1ICS50) and Mifare 4k (MF1ICS70) wired-logic contactless cards.

Mifare 1k is divided into 64 16-byte blocks.

Mifare 4k is divided into 256 16-byte blocks.

Both cards have a 4-byte serial number, located at the beginning of block 0. As those cards are ISO/IEC 14443-3 compliant, you can read the serial number through the generic ID-Only template, instead of using this dedicated template.

3.3.1. Lookup list

Name	Tag	Description	Size
LKL.MIF	${}_n t0$	Mifare classic lookup list, value = ${}_n 61$. See 3.1.1.a for details.	1

3.3.2. Output format

Name	Tag	Description	Size
TOF.MIF	${}_n t1$	Mifare output format. See table a below.	1

a. Output format bits

Bit	Value	Meaning
7	0	Do not swap bytes
	1	Swap bytes
6	0	RAW data
	1	ASCII encoded data ²³
5	0	Left-padding with ${}_n 0$ (RAW) or <SPACE> (ASCII)
	1	Right-padding with ${}_n F$ (RAW) or <SPACE> (ASCII)
4	0	Long string reading option ²⁴ Disable long string reading option
	1	Enable long string reading option
3 – 0		Output length Format depends on bit 6 (RAW or ASCII). See table b below for RAW data (bit 6 = 0) See table c below for ASCII data (bit 6 = 1)

Default value : ${}_b 00000010$

²³ If data read from the memory card is "31 32 33 43 34 35" (hexadecimal notation), output will be "123C45". Make sure that only valid digits (values from 31 to 39 and 41 to 46 or 61 to 66) are encoded in every card, otherwise actual reader output will be undefined.

²⁴ This option is only available on Prox'N'Roll RFID Scanner, RDR-K632 and ProxRunner. If working with IWM-K632 or FunkyGate, please ignore this configuration tag.

b. Output length when bit 6 = 0

Bit	Value	Meaning
3 – 0	0000	Decimal, 4 bytes seen as 10 digits (i.e. 32 → 40 bits expansion)
	0001	Fixed length, 4 bytes (32 bits)
	0010	Fixed length, 8 bytes (64 bits)
	0011	Fixed length, 5 bytes (40 bits)
	0100	Fixed length, 12 bytes (96 bits)
	0101	Fixed length, 7 bytes (56 bits)
	0110	Fixed length, 11 bytes (88 bits)
	0111	RFU
	1000	Fixed length, 16 bytes (128 bits)
	1001	RFU
	1010	RFU
	1011	RFU
	1100	Decimal, 5 bytes seen as 12 digits (i.e. 40 → 56 bits expansion)
	1101	Decimal, 5 bytes seen as 13 digits (i.e. 40 → 64 bits expansion)
	1110	Decimal, variable length (maximum 13 digits)
	1111	Variable length (using _h 0 and _h F as end of string markers)

c. Output length when bit 6 = 1

Bit	Value	Meaning
3 – 0	0000	Max output length = _d 16
	0001	Max output length from _d 1 to _d 15
	to	
	1111	

3.3.3. Output prefix

Name	Tag	Description	Size
PFX.MIF	_h t2	Mifare output prefix.	Var.

Same as ID-only output prefix (see 3.2.3).

3.3.4. Location of data

Depending on the size, the LOC.MIF tag can either be

- A block number (= address of data in Mifare card) when size = 1,
- An Application Identifier (AID) when size = 2.

a. Fixed block number

Name	Tag	Description	Size
LOC.MIF	$_{ht}3$	Block number to be read.	1

Default value : $_{b}00000100$ ($_{d}4$)

When a Mifare card is found, the reader tries to read the block specified in LOC.MIF (16 bytes), and then truncates the data according to the length specified in TOF.MIF.

The block number shall be

- Between 0 and 63 for Mifare 1k cards,
- Between 0 and 255 for Mifare 4k cards.

Note that data must start on a block boundary.

Mifare sector trailers (security blocks) numbered 3, 7, ... can be read, but their content is masked (to protect the keys). Using such a block as access control identifier is definitely not a good idea.

b. AID in MAD

Name	Tag	Description	Size
LOC.MIF	$_{ht}3$	AID to be selected and read.	2

When a Mifare card is found, reader reads the MAD (blocks 1 and 2 of sector 0)²⁵ and tries to find the specified AID. The location of the AID in the MAD is the pointer onto the actual block to be read.

Note that data must be located at the beginning of the first block marked with the specified AID.

Please refer to NXP application notes for detailed explanations of the MAD.

²⁵ Sector 0 must be freely readable either with base key A ("A0 A1 A2 A3 A4 A5"), with transport key ("FF FF FF FF FF FF") or with the application key specified in AUT.MIF .

3.3.5. Authentication key

Depending on the size, the AUT.MIF tag can either be

- A pointer to a key located in RC's secure EEPROM when size = 1.
- The Mifare key itself, when size = 7,
- A master key and its diversification options, when size = 9 or 17

When the AUT.MIF tag is absent, all EEPROM keys are tried out in sequence (this can take a long time...).

Name	Tag	Description	Size
AUT.MIF	$_{ht}5$	Mifare authentication key. Default value : absent	See below

a. Size = 1 : pointer to a key in RC's secure EEPROM

- Values $_{h}00$ to $_{h}0F$ refer to type A keys $_{d}0$ to $_{d}15$, respectively,
- Values $_{h}80$ to $_{h}8F$ refer to type B keys $_{d}0$ to $_{d}15$, respectively.

b. Size = 7 : specified Mifare key

Offset	Length	Content
0	1	Key options. See table c below.
1	6	Mifare key value.

c. Key options bits, when size = 7

Bit	Value	Meaning
7	0	Key is an A key
	1	Key is a B key
6 – 0		RFU

d. Size = 17 : master key diversification using HMAC-MD5

Offset	Length	Content
0	1	Key options. See table e below.
1	16	Master key value.

e. Key options bits, when size = 17

Bit	Value	Meaning
7	0	Diversified key is an A key
	1	Diversified key is a B key
6	0	Diversification with card UID and address fixed to $_{h}00$
	1	Diversification with card UID and address = sector number
5 – 4	10	Diversify the key using HMAC-MD5 algorithm
3 – 0		RFU

f. Size = 15 or 23 : master key diversification using RC171 algorithm

Offset	Length	Content
0	1	Key options. See table g below.
1	6	Mifare master key.
7	8 or 16	DES or 3-DES diversification key.

g. Key options bits, when size = 15 or 23

Bit	Value	Meaning
7	0	Diversified key is an A key
	1	Diversified key is a B key
6	0	Diversification with card UID and address fixed to $_{h}00$
	1	Diversification with card UID and address = sector number
5 – 4	01	Diversify the key using RC171 algorithm
3 – 0		RFU

3.3.6. Reading a long string from a Mifare Classic card

Note : This option is only available on Prox'N'Roll RFID Scanner, RDR-K632 and ProxRunner.

When bits 4 and 6 in TOF.MIF are set (ASCII output, long string reading extension enabled), the reader behaves as follow :

- The output length (bits 0 to 3 of TOF.MIF) is ignored,
- The reader reads sequentially all Mifare data blocks starting at address specified in LOC.MIF (absolute address or pointer found in MAD), until one of those events occurs :
 - The end-of-string character ('\0' i.e. $_{h}00$) is read,
 - The end of the card is reached,
 - The authentication failed (see note below),
 - 4 blocks (64 bytes) have been read.

Doing so, the reader is able to fetch ASCII strings up to 64 characters.

Note : in this mode, the reading may cross a sector boundary (64 bytes is 4 blocks, where sectors below 32 are 3-block wide). In this case, the two sectors to be read must be formatted with the same Mifare key and the same access mode.

3.4. MIFARE ULTRALIGHT ACCEPTANCE TEMPLATE

NXP Mifare UltraLight is a low-cost wired-logic contactless cards. It is divided into 16 4-byte pages. This template reads 4 pages (i.e. exactly 16 bytes) at once.

This card has a 7-byte serial number, located on blocks 0 and 1. As the card is ISO/IEC 14443-3 compliant, you can read the serial number through the generic ID-Only template, instead of using this dedicated template.

3.4.1. Lookup list

Name	Tag	Description	Size
LKL.MFU	$_h t0$	Mifare UltraLight lookup list, value = $_h 62$. See 3.1.1.a for details.	1

3.4.2. Output format

Name	Tag	Description	Size
TOF. MFU	$_h t1$	Mifare UltraLight output format.	1

Same as Mifare Classic output format (see 3.3.2).

3.4.3. Output prefix

Name	Tag	Description	Size
PFX.MFU	$_h t2$	Mifare UltraLight output prefix.	Var.

Same as ID-only output prefix (see 3.2.3).

3.4.4. Location of data

Name	Tag	Description	Size
LOC.MFU	$_h t3$	Number of the first page to be read.	1

Default value : $_b 00000000$ ($_d 0$)

Remember that this template always reads 4 pages (16 bytes) starting at LOC.MFU.

3.4.5. Reading a long string from a Mifare UltraLight card

Note : This option is only available on Prox'N'Roll RFID Scanner, RDR-K632 and ProxRunner.

When bits 4 and 6 in TOF.MIF are set (ASCII output, long string reading extension enabled), the reader behaves as follow :

- The output length (bits 0 to 3 of TOF.MIF) is ignored,
- The reader reads sequentially all Mifare data blocks starting at address specified in LOC.MIF (absolute address or pointer found in MAD), until one of those events occurs :
 - The end-of-string character ('\0' i.e. h00) is read,
 - The end of the card is reached,
 - 16 pages (64 bytes) have been read.

Doing so, the reader is able to return ASCII strings up to 64 characters²⁶.

²⁶ Well, not really, as Mifare UltraLight currently features only 64 bytes of data, with only 48 bytes actually usable to store data.

3.5. DESFIRE ACCEPTANCE TEMPLATE

Desfire Acceptance Template has been designed for the first version of NXP Desfire 4k cards (MF3ICD40).

It should work with new Desfire versions (MF3ICD21, MF3ICD41 and MF3ICD81) as long as they are configured to remain compatible with the earlier version (DES or two-key Triple-DES authentication, same ATQ/SAK as MF3ICD40).

3.5.1. Lookup list

Name	Tag	Description	Size
LKL.DFR	h_t0	Desfire lookup list, value = $h71$. See 3.1.1.a for details.	1

3.5.2. Output format

Name	Tag	Description	Size
TOF.DFR	h_t1	Desfire output format.	1

Same as Mifare Classic output format (see 3.3.2).

3.5.3. Output prefix

Name	Tag	Description	Size
PFX.DFR	h_t2	Desfire output prefix.	Var.

Same as ID-only output prefix (see 3.2.3).

3.5.4. Location of data

Name	Tag	Description	Size
LOC.DFR	h_t3	Location of data in Desfire card. See table a below.	8

a. Data location bytes

Offset	Length	Content
0	3	Application IDentifier (AID).
3	1	File IDentifier (FID). File must be a "standard data" file.
4	3	Offset of data in file.
7	1	Length of data to be read ²⁷ (1 to 64).

Default value : unspecified.

Values are MSB first.

²⁷ Data will be truncated to the length specified in TOF.DFR, unless the long string reading extension is enabled.

3.5.5. T=CL options

Name	Tag	Description	Size
OPT.DFR	_h t4	Desfire T=CL options.	1

Same as 7816-4 T=CL options (see 3.5.5).

3.5.6. Authentication key

Name	Tag	Description	Size
AUT.DFR	_h t5	Desfire authentication key. See table a below.	9 or 17

Default value : absent

(No authentication is performed, plain read operation is used to fetch the data)

a. Authentication key bytes

Offset	Length	Content
0	1	Desfire key index and options. See table b below.
1	8 or 16	Key value (8 bytes for a DES key, 16 bytes for a 3-DES key).

b. Key index and options

Bit	Value	Meaning	
7 – 6	00	Communication mode for reading Plain	
	01		MACed with session key
	10		RFU
	11		Enciphered with session key
5 – 4	00	Key diversification algorithm Use the key "as is"	
	01		Diversify the key using Desfire SAM algorithm
	10		Diversify the key using HMAC-MD5 algorithm
	11		RFU
3 – 0	0000	Index of key in Desfire application Index of the key to be used for authentication	
	to		
	1110		
	1111		RFU

3.5.7. Reading a long string from a Desfire card

Note : This option is only available on Prox'N'Roll RFID Scanner, RDR-K632 and ProxRunner.

When bits 4 and 6 in TOF.DFR are set (ASCII output, long string reading extension enabled), the reader behaves as follow :

- The output length (bits 0 to 3 of TOF.DFR) is ignored,
- The reader reads the data up to the length specified in LOC.DFR (64 bytes max.),
- The reader returns those bytes as an ASCII string, truncated at the correct length when the end-of-string character ('\0' i.e. h00) is reached.

Doing so, the reader is able to fetch ASCII strings up to 64 characters.

3.6. ISO 7816-4 ACCEPTANCE TEMPLATE

3.6.1. Lookup list

Name	Tag	Description	Size
LKL.TCL	h_t0	7816-4 lookup list, $h_{11} \leq \text{value} \leq h_{13}$. See 3.1.1.a for details.	1

3.6.2. Output format

Name	Tag	Description	Size
TOF.TCL	h_t1	T=CL output format.	1

Same as Mifare Classic output format (see 3.3.2).

3.6.3. Output prefix

Name	Tag	Description	Size
PFX.TCL	h_t2	T=CL output prefix.	Var.

Same as ID-only output prefix (see 3.2.3).

3.6.4. Location of data

Name	Tag	Description	Size
LOC.TCL	h_t3	Offset of data in answer to APDU 3^{28} (0 to 127). Default value : 0.	1

3.6.5. T=CL options

Name	Tag	Description	Size
OPT.TCL	h_t4	T=CL (ISO/IEC 14443 layer 4) options. See table a below.	1

²⁸ Data will be truncated according to the length specified in TOF.TCL .

a. T=CL option bits

Bit	Value	Meaning
7 – 6	00	Card to reader baudrate No PPS, DSI = 106kbit/s
	01	Perform PPS, DSI = 212kbit/s if card allows it
	10	Perform PPS, DSI = 424kbit/s if card allows it
	11	Perform PPS, DSI = 848kbit/s if card allows it
5 – 4	00	Reader to card baudrate No PPS, DRI = 106kbit/s
	01	Perform PPS, DRI = 212kbit/s if card allows it
	10	Perform PPS, DRI = 424kbit/s if card allows it
	11	Perform PPS, DRI = 848kbit/s if card allows it
3 – 0	0000	Card identifier (CID) Empty CID = d_0
	0001	CID from d_1 to d_{14}
	to	
	1110	CID is disabled
1111		

This tag exists only if T=CL card is selected in LST.

Default value : $b_00001111$

3.6.6. T=CL APDU 1

Typically this is a Select Application (or Select Applet) command.

May be absent if T=CL APDU 3 is sufficient to fetch the data.

Name	Tag	Description	Size
AU1.TCL	h_t5	TCL APDU 1.	Var.

Card's Status Word is checked by the reader. A SW between h_9000 and h_9FFF is considered valid. Any other value for SW (and in particular error values as defined by ISO 7816-4 between h_6100 and h_6FFF) is considered as an error, and the reader will ignore the card.

Reader's internal buffer is limited to 128 bytes. If card's answer is longer, the answer will be discarded and the reader will ignore the card.

3.6.7. T=CL APDU 2

Typically this is a Select File command.

May be absent if T=CL APDU 3 is sufficient to fetch the data.

Name	Tag	Description	Size
AU2.TCL	$_{ht}6$	TCL APDU 2.	Var.

Card's Status Word is checked by the reader. A SW between $_{h}9000$ and $_{h}9FFF$ is considered valid. Any other value for SW (and in particular error values as defined by ISO 7816-4 between $_{h}6100$ and $_{h}6FFF$) is considered as an error, and the reader will ignore the card.

Reader's internal buffer is limited to 128 bytes. If card's answer is longer, the answer will be discarded and the reader will ignore the card.

3.6.8. T=CL APDU 3

APDU used to actually retrieve the data (typically this is a Read Binary command). Data have to be found in answer at offset specified in LOC.TCL.

Name	Tag	Description	Size
AU3.TCL	$_{ht}7$	TCL APDU 3.	Var.

Card's Status Word is checked by the reader. A SW between $_{h}9000$ and $_{h}9FFF$ is considered valid. Any other value for SW (and in particular error values as defined by ISO 7816-4 between $_{h}6100$ and $_{h}6FFF$) is considered as an error, and the reader will ignore the card.

Reader's internal buffer is limited to 128 bytes. If card's answer is longer, the answer will be discarded and the reader will ignore the card.

3.6.9. Reading a long string from a T=CL card

Note : This option is only available on Prox'N'Roll RFID Scanner, RDR-K632 and ProxRunner.

When bits 4 and 6 in TOF.TCL are set (ASCII output, long string reading extension enabled), the reader behaves as follow :

- The output length (bits 0 to 3 of TOF.TCL) is ignored,
- The reader fetches the data from offset LOC.TCL up to the length of the response to APDU 3 (64 bytes max.),
- The reader returns those bytes as an ASCII string, truncated at the correct length when the end-of-string character ('\0' i.e. h00) is reached.

Doing so, the reader is able to fetch ASCII strings up to 64 characters.

3.7. CALYPSO ACCEPTANCE TEMPLATE

This part deals with old Calypso cards, to be accessed only through the legacy Innovatron radio protocol.

New Calypso cards now support ISO/IEC 14443-B, and therefore can be accessed either through ID-Only or ISO/IEC 7816-4 templates.

Working with Calypso cards is subject to a specific licence fee. This function is therefore disabled in our readers, unless you order them with the Calypso option.

Depending on the specified options, this Calypso card processing template can retrieve :

- A 4-byte serial number (ID-Only template)
- Arbitrary data to be read in Calypso files (7816-4 template)

3.7.1. Lookup list

Name	Tag	Description	Size
LKL.CYO	$\text{h}t0$	Calypso/Innovatron lookup list, value = $\text{h}72$. See 3.1.1.a for details.	1

3.7.2. Output format

Name	Tag	Description	Size
TOF.CYO	$\text{h}t1$	Calypso/Innovatron output format.	1

Same as Mifare Classic output format (see 3.3.2).

3.7.3. Output prefix

Name	Tag	Description	Size
PFX.CYO	$\text{h}t2$	Calypso/Innovatron output prefix.	Var.

Same as ID-only output prefix (see 3.2.3).

3.7.4. Location of data

Name	Tag	Description	Size
LOC.CYO	$_h t3$	Offset of data in answer to APDU 3 ²⁹ (0 to 64).	1

Default value : 0.

3.7.5. Calypso APDU 1

Typically this is a Select Application, or Select DF command.

Name	Tag	Description	Size
AU1.CYO	$_h t5$	Calypso/Innovatron APDU 1.	Var.

Card's Status Word is checked by the reader. A SW between $_h 9000$ and $_h 9FFF$ is considered valid. Any other value for SW (and in particular error values as defined by ISO 7816-4 between $_h 6100$ and $_h 6FFF$) is considered as an error, and the reader will ignore the card.

Reader's internal buffer is limited to 128 bytes. If card's answer is longer, the answer will be discarded and the reader will ignore the card.

3.7.6. Calypso APDU 2

Typically this is a Select EF command.

Name	Tag	Description	Size
AU2.CYO	$_h t6$	Calypso/Innovatron APDU 2.	Var.

Card's Status Word is checked by the reader. A SW between $_h 9000$ and $_h 9FFF$ is considered valid. Any other value for SW (and in particular error values as defined by ISO 7816-4 between $_h 6100$ and $_h 6FFF$) is considered as an error, and the reader will ignore the card.

Reader's internal buffer is limited to 128 bytes. If card's answer is longer, the answer will be discarded and the reader will ignore the card.

²⁹ Data will be truncated according to the length specified in TOF.CYO .

3.7.7. Calypso APDU 3

Typically this is a Read Binary command.

Name	Tag	Description	Size
AU3.CYO	$_h t7$	Calypso/Innovatron APDU 3	Var.

Card's Status Word is checked by the reader. A SW between $_h 9000$ and $_h 9FFF$ is considered valid. Any other value for SW (and in particular error values as defined by ISO 7816-4 between $_h 6100$ and $_h 6FFF$) is considered as an error, and the reader will ignore the card.

Reader's internal buffer is limited to 128 bytes. If card's answer is longer, the answer will be discarded and the reader will ignore the card.

4. CONFIGURING IWM-K632

There are two ways to configure **IWM-K632** :

- Using a Master Card, formatted with **cfgfilecreator.exe** software. See chapters 8 and 9 for details,
- Manually, by entering configuration values in reader's console (serial line access), as shown below.

In both cases, three of the four jumpers enable or prevent LEDs and buzzer operation.

The first jumper enables the serial line access for console operation.

Whatever the hardware, default factory settings for **IWM-K632** firmware are :

- RS-485 mode, 38400bps,
- Reads any kind of ID, 8 byte fixed length output.

Always configure IWM-K632 properly before installation as there're little chances that default configuration matches your requirements.

4.1. HARDWARE JUMPERS

4 jumpers are available for basic configuration of the device.

The default (out of factory) settings are specified by a grey background.

Depending on the actual hardware, the 4 jumpers have different functions. Verify the label under the product and refer to the appropriate paragraph below.

4.1.1. IWM-K632-WD

Jumper	ON	OFF
1	Operation mode	Trace-enabled mode
2	Red LED input disabled	Red LED input enabled
3	Green LED input disabled	Green LED input enabled
4	Buzzer enabled	Buzzer disabled

4.1.2. IWM-K632-SU

Jumper	ON	OFF
1	Operation mode	Trace-enabled mode
2	Flash mode	Normal mode
3	Buzzer enabled	Buzzer disabled
4	RFU	RFU

Switch JP3 allows selection between USB and RS-232 mode.

4.1.3. IWM-K632-WD Mk2

Jumper	ON	OFF
1	Flash mode	Normal mode
2	Operation mode	Trace-enabled mode
3	Red & Green LED input enabled	Red & Green LED input disabled
4	Buzzer enabled	Buzzer disabled

4.1.4. IWM-K632-SU Mk2

Jumper	ON	OFF
1	Operation mode	Trace-enabled mode
2	Flash mode	Normal mode
3	Buzzer enabled	Buzzer disabled
4	RFU	RFU

4.1.5. Note on the trace-enabled mode

The "trace-enabled mode" jumper has three effects :

- Enable serial line access when the reader is configured for Dataclock or Wiegand operation (since serial line is multiplexed with Dataclock / Wiegand outputs, it is otherwise disabled),
- Force serial communication baudrate to 38400bps,
- Activate the echo on the serial line, and enable a few trace message for testing purpose.

"trace-enabled mode" inhibits normal operation of the reader.

Do not forget to switch back "trace-enabled mode" jumper to OFF before actually installing the reader.

4.2. CONNECTING IWM-K632 TO A COMPUTER

4.2.1. IWM-K632-WD

Use **SpringCard INT-USB-TTL** as USB interface between the reader (through its PC-Link Connector) and a computer running Microsoft Windows. Alternatively, you may use new interface **SpringCard INT-USB-ITL**.

Install software ref. **SDD100** "USB Driver for SpringCard's FTDI-based devices" to see the interface as a virtual serial port (VCP).

4.2.2. IWM-K632-WD Mk2

In **IWM-K632-WD Mk2**, the PC-Link Connector has been replaced by an infrared interface (IrDA).

Use **SpringCard INT-USB-ITL** as USB interface between the reader (through IrDA) and a computer running Microsoft Windows. Make sure that the **INT-USB-ITL**'s IrDA port is kept in from of reader's IrDA port during communication, at a distance of about 10cm.

Install software ref. **SDD100** "USB Driver for SpringCard's FTDI-based devices" to see the interface as a virtual serial port (VCP).

Note : Using a computer's built-in IrDA interface is unsupported.

4.2.3. IWM-K632-SU and IWM-K632-SU Mk2

Connect the reader directly to the computer using either the serial line (RS-232) or the USB interface (type B connector).

When using the USB interface, install software ref. **SDD100** "USB Driver for SpringCard's FTDI-based devices" to see the reader as a virtual serial port (VCP).

4.2.4. Connection information

Use HyperTerminal or any compliant terminal emulator to get connected onto the reader through the serial port. Default communication settings are :

- 8 data bits, 1 stop, no parity, no flow control ;
- Baudrate = 38400bps³⁰.

4.2.5. Testing connection

- Move the corresponding switch to "trace-enabled mode" position,
- Power-up (or reset) the reader,
- Reader sends its identification string :

```
SpringCard IWMK632 1.25
```

4.3. RETRIEVING IWM-K632 INFORMATION

4.3.1. Firmware version

Enter "ver" to read **IWM-K632** firmware version.

4.3.2. Firmware configuration

Enter "sho" to read **IWM-K632** configuration.

³⁰ Baudrate may be altered by configuration, but default baudrate (38400bps) is always restored when the "trace-enabled mode" switch is set.

4.4. ENABLING CONFIGURATION COMMANDS

IWM-K632 configuration may be protected by a pin-code (if PIN configuration tag is empty, no pin-code is needed.
If defined to `_hFFFF`, configuration commands are permanently disabled).

Enter `"pinNNNN"` to allow configuration commands, where NNNN is the actual pin-code (for instance, `"pin1234"`)³¹.

4.5. ACCESSING IWM-K632 CONFIGURATION

4.5.1. Reading configuration tags

Enter `"cfg"` to list all configuration tags.

Enter `"cfgXX"` to read value configuration tag XX (hexadecimal address).

Note that configuration tags `_h55`, `_h56` and `_h6F` (keys used by Master Cards and pin-code) are masked when read back.

4.5.2. Writing configuration tags

Enter `"cfgXX=YYYY"` to update configuration tag XX (hexadecimal address) with value YYYY (hexadecimal value).

Enter `"cfgXX=!"` to delete configuration tag XX (hexadecimal address).

4.5.3. Writing keys in RC's secure EEPROM

Enter `"keya0=XXXXXXXXXXXX"` to update key A at index 0, `"keya1=..."` to update key A at index 1, and so on until `"keyaf=..."`.

Enter `"keyb0=XXXXXXXXXXXX"` to update key B at index 0, `"keyb1=..."` to update key B at index 1, and so on until `"keybf=..."`.

Note that keys stored in RC can't be read back.

4.5.4. Reading RC's 4-byte EEPROM

RC's chipset includes a 4-byte EEPROM to store a configuration value.

Enter `"cfgRC"` to read this 4-byte value.

4.5.5. Writing RC's 4-byte EEPROM

RC's chipset includes a 4-byte EEPROM to store a configuration value.

³¹ For security reasons, configuration commands are enabled only for 3 minutes. After 3 minutes of inactivity, you'll have to enter the pin-code again.

Enter "cfgRC=XXXXXXXX" to write this 4-byte value.

Content of RC's 4-byte EEPROM is currently not used by **IWM-K632** firmware (but it is the configuration vector for former **IWM-K531** firmware).

Please keep this value to 00000000 as it may be used in future versions.

4.6. APPLYING NEW CONFIGURATION

New configuration is applied only after reset.

Cycle power or enter "rst" to reset the reader.

4.7. REVERTING TO DEFAULT

Sometimes it is necessary to put reader back in "out-of-factory" configuration (for instance when reader goes from one site to another). This is done easily by erasing all tags from reader's memory.

Enter "cfg!!!=" to delete all configuration tags.

There's no confirmation prompt nor any kind of "are you sure?" popup window. Erasing everything is immediate and unrecoverable.

Erasing all the configuration tags is not really enough to put the reader(s) back in out-of-factory configuration, since Mifare keys stored in RC's secure EEPROM are not erased.

Read paragraph 3.5.3 to see how the keys may be overwritten.

5. SERIAL MODE APPLICATION NOTE

5.1. THE RS-485 INTERFACE

IWM-K632-DW and IWM-K632-DW Mk2 only

a. Pins

Pins 3 and 4 are RS-485 A and RS-485 B, respectively.

b. Communication parameters

Default baudrate is 38400bps. See 2.3.3 if you need to change this value.

Other parameters are :

- 8 data bits, 1 stop bit
- No parity, no flow control.

Those parameters can't be altered.

5.2. THE RS-232 AND USB INTERFACES

IWM-K632-SU and IWM-K632-SU Mk2 only

Default baudrate is 38400bps. See 2.3.3 if you need to change this value.

Other parameters are :

- 8 data bits, 1 stop bit
- No parity, no flow control.

Those parameters can't be altered.

5.3. SERIAL OUTPUT

5.3.1. Frame markers

Serial frame markers are configured by bits 7-5 of SER .

a. When addressing is disabled

Consider data '01 23 45 67',

- If bits 7-5 = $_b000$, frame is "01234567".
- If bits 7-5 = $_b001$, frame is "01234567<CR><LF>" where <CR> the ASCII carriage return ($_h0D$), and <LF> the ASCII line feed ($_h0A$).
- If bits 7-5 = $_b010$, frame is "<BEL>01234567<CR><LF>" where <BEL> is the ASCII bell (or ring) character ($_h07$), <CR> the ASCII carriage return ($_h0D$), and <LF> the ASCII line feed ($_h0A$).

- If bits 7-5 = $b011$, frame is "<TAB>01234567<CR><LF>" where <TAB> is the ASCII horizontal tab character ($h09$), <CR> the ASCII carriage return ($h0D$), and <LF> the ASCII line feed ($h0A$).
- If bits 7-5 = $b100$, frame is "<STX>01234567<ETX>" where <STX> is the ASCII "start of text" character ($h02$), and <ETX> the ASCII "end of text" ($h03$).
- If bits 7-5 = $b101$, frame is "<STX>01234567<ETX><CR><LF>".
- If bits 7-5 = $b110$, frame is "<BEL><STX>01234567<ETX><CR><LF>".
- If bits 7-5 = $b111$, frame is "<TAB><STX>01234567<ETX><CR><LF>".

b. When addressing is enabled

Consider data '01 23 45 67' and address 'a' ($h1 \leq a \leq hE$),

- If bits 7-5 = $b000$, frame is "a>01234567".
- If bits 7-5 = $b001$, frame is "a>01234567<CR><LF>".
- If bits 7-5 = $b010$, frame is "<BEL>a>01234567<CR><LF>".
- If bits 7-5 = $b011$, frame is "<TAB>a>01234567<CR><LF>".
- If bits 7-5 = $b100$, frame is "<SOH>a><STX>01234567<ETX>" where <SOH> is the ASCII "start of header" character ($h01$).
- If bits 7-5 = $b101$, frame is "<SOH>a><STX>01234567<ETX><CR><LF>".
- If bits 7-5 = $b110$, frame is "<BEL><SOH>a><STX>01234567<ETX><CR><LF>".
- If bits 7-5 = $b111$, frame is "<TAB><SOH>a><STX>01234567<ETX><CR><LF>".

5.4. SERIAL INPUT

IWM-K632 accepts short commands from the host, to drive LEDs and buzzer output mostly.

IWM-K632 doesn't echo received data (unless "console mode" jumper is ON).

If received command has been understood by IWM-K632, it replies with <ACK> before executing the requested action. Otherwise, it replies with <NACK>.

5.4.1. When addressing is disabled

Command transmission format is <command> <CR> <LF>.

5.4.2. When addressing is enabled

Command transmission format is <address> < <command> <CR> <LF>, where <address> must be the address of the device.

5.4.3. List of commands

Command	Action
A0	Reader goes inactive (tag polling is halted)
A1	Reader goes active
R0	Switch red LED off
R1	Switch red LED on
R2	Red LED blinks slowly
R3	Red LED blinks quickly
G0	Switch green LED off
G1	Switch green LED on
G2	Green LED blinks slowly
G3	Green LED blinks quickly
Z0	Stop buzzer
Z1	Start buzzer
Z2	Short buzzer sound
Z3	Long buzzer sound
Margz	Same as sending <i>Aa + Rr + Gg + Zz</i>
Mrg	Same as sending <i>Rr + Gg</i>
Marg	Same as sending <i>Aa + Rr + Gg</i>
RST	Reset the reader
VER	Retrieve reader's version
SHO	Retrieve reader's settings

Set jumpers appropriately, and choose proper configuration in CLD and CBZ to allow the device to control its LEDs and/or its buzzer.

6. WIEGAND APPLICATION NOTE

IWM-K632-DW and IWM-K632-DW Mk2 only

6.1. THE WIEGAND INTERFACE

a. Pins

Pins 5 and 6 are Wiegand DATA0 and DATA1 outputs, respectively.

- Both pins are at high level when idle,
- A low pulse on DATA0 denotes a bit 0 output,
- A low pulse on DATA1 denotes a bit 1 output.

In normal operation, DATA0 and DATA1 are never at low level simultaneously.

b. Signals

c. Timings

Those are the default timings ; they can be altered by writing into WGD configuration tag :

It is better that the controller triggers on the falling edge of the signal or on the low level, and not on the rising edge.

6.2. ELECTRICAL LEVELS

The electrical interface has changed between IWM-K632-DW and IWM-K632-DW Mk2. Be sure to configure the controller interface according to reader's needs.

a. IWM-K632-DW

DATA0 and DATA1 are not open collector outputs. Pull-up resistors (to a 5V level) are embedded in the reader and can't be disabled.

You must connect this reader to an high-impedance input only.

	V_{out}
Output level high	4.0V min, 5.5V max
Output level low	0.0V min, 1.0V max

b. IWM-K632-DW Mk2

DATA0 and DATA1 are open collector outputs. Pull-up resistors (R_{ctrl}) must be supplied by the controller (to V_{ctrl} level).

Maximum values are :

- $V_{ctrl} = 15V$
- $I_{max} = 10mA$

Typical values are :

- $V_{ctrl} = 5V$ $R_{ctrl} = 4,7k\Omega$ ($I_{max} = 1,0mA$)
- $V_{ctrl} = 12V$ $R_{ctrl} = 10k\Omega$ ($I_{max} = 1,2mA$)

6.3. FRAME FORMAT

Wiegand output format is fully driven by the templates.

6.4. LED INTERFACE

Pins 7 and 8 are respectively red and green LEDs inputs.

	Meaning	Level to GND
Input level high	LED is ON	3.3V to 5.5V
Input level low	LED if OFF	0.0V to 1.7V

The reader has an internal pull-up resistor to 5V.

Set jumpers appropriately, and choose proper configuration in CLD to allow an external control of the LEDs.

7. DATACLOCK APPLICATION NOTE

IWM-K632-DW and IWM-K632-DW Mk2 only

7.1. THE DATACLOCK INTERFACE

a. Pins

Pins 5 and 6 are Dataclock DATA and CLOCK outputs, respectively.

- Both pins are at high level when idle,
- The CLOCK line is active low,
- The DATA line is inverting (low level means 1, high level means 0).

b. Signals

data stream 0 0 1 0 1 1 0

c. Timings

Default clock period is 1ms (approx.) with a duty cycle 1/3 (330µs inactive, 330µs active low, 330µs inactive). Those timings can be altered by writing into DTC configuration tag.

It is better that the controller triggers on the falling edge of the clock or on the low level, and not on the rising edge.

7.2. ELECTRICAL LEVELS

The electrical interface has changed between IWM-K632-DW and IWM-K632-DW Mk2. Be sure to configure the controller interface according to reader's needs.

a. IWM-K632-DW

DATA and CLOCK are not open collector outputs. Pull-up resistors (to a 5V level) are embedded in the reader and can't be disabled.

You must connect this reader to an high-impedance input only.

	V_{out}
Output level high	4.0V min, 5.5V max
Output level low	0.0V min, 1.0V max

b. IWM-K632-DW Mk2

DATA and CLOCK are open collector outputs. Pull-up resistors (R_{ctrl}) must be supplied by the controller (to V_{ctrl} level).

Maximum values are :

- $V_{ctrl} = 15V$
- $I_{max} = 10mA$

Typical values are :

- $V_{ctrl} = 5V$ $R_{ctrl} = 4,7k\Omega$ ($I_{max} = 1,0mA$)
- $V_{ctrl} = 12V$ $R_{ctrl} = 10k\Omega$ ($I_{max} = 1,2mA$)

7.3. DIGIT FORMAT

Dataclock only transmit decimal data. Each digit is transmitted as 5 bits :

- 4 digit bits, least significant bit first,
- 1 parity bit.

Data are BCD-encoded, i.e. only decimal values from 0 to 9 are valid for data digits. Values above 10 (hexadecimal values from A to F) are reserved.

Dataclock digit format

Value	Bit pattern
0	0 0 0 0 1
1	1 0 0 0 0
2	0 1 0 0 0
3	1 1 0 0 1
4	0 0 1 0 0
5	1 0 1 0 1
6	0 1 1 0 1
7	1 1 1 0 0
8	0 0 0 1 0
9	1 0 0 1 1

Value	Bit pattern	Reserved for
A (10)	0 1 0 1 1	
B (11)	1 1 0 1 0	Start sentinel
C (12)	0 0 1 1 1	
D (13)	1 0 1 1 0	Separator
E (14)	0 1 1 1 0	
F (15)	1 1 1 1 1	Stop sentinel

7.4. ISO2 / MAGSTRIPE FRAMES

7.4.1. Frame content

When the ISO2 / Magstripe format is selected (bit 7 = 0 in DTC), only decimal digits (0 to 9) are allowed. This is OK when data read from the card is actually decimal numbers.

In case data is not composed of numbers but arbitrary binary values, a translation must be applied before actual transmission. This translation is defined by bits 3-2 of DTC.

Consider the data '00 7A 12 6C 59 F4 04' in hexadecimal notation (this is the serial number of a Mifare Ultralight card). Digits 'A' and 'F' are not allowed in the frame.

a. Discard non-decimal

- If bits 3-2 = $_b00$, frame will be '00712659404'.

b. Replace by separators

- If bits 3-2 = $_b01$, frame will be '007-126-59-404' where '-' is the dataclock separator character (digit $_hD$).

c. Translation method 1

- If bits 3-2 = $_b10$, frame will be '0000071001020601250915040004'. Note that each data digit (hexadecimal $_h0$ to $_hF$) has been replaced by two decimal digits ($_d00$ to $_d15$). Frame length is twice as big as data length.

d. Translation method 2

- If bits 3-2 = $_b11$, frame will be '007_0126_259_5404'. Note that valid decimal digits have been transmitted "as is", where digits from $_hA$ to $_hF$ ($_d10$ to $_d15$) have been replaced by the '-' separator followed by the divided-by-10 reminder.

7.4.2. Frame prefix and postfix

ISO2/Magstripe frames are transmitted according to following protocol :

1. Left edge : bit 0 is transmitted 16 times,
2. Start sentinel (hexadecimal digit B, i.e. bit pattern "1 1 0 1 0"),
3. Actual frame content as specified in 2.2.5,
4. Stop sentinel (hexadecimal digit F, i.e. bit pattern "1 1 1 1 1"),
5. LRC of frame (XOR computed over parts 1, 2 and 3),
6. Right edge : bit 0 is transmitted 16 times.

7.5. RAW FRAMES

7.5.1. Frame content

When the RAW format is selected (bit 7 = 1 in DTC), data are sent "as is", any digit from d_0 (h0) to d_{15} (hF) being allowed.

7.5.2. Frame prefix and postfix

RAW frames are transmitted without prefix and postfix.

7.6. LED INTERFACE

Pins 7 and 8 are red and green LEDs inputs, respectively.

	Meaning	Level to GND
Input level high	LED is OFF	3.3V to 5.5V
Input level low	LED if ON	0.0V to 1.7V

The reader has an internal pull-up resistor to 5V.

Set jumpers appropriately, and choose proper configuration in CLD to allow an external control of the LEDs.

8. CREATING MASTER CARDS USING SQ844P SOFTWARE

8.1. OVERVIEW

Master Cards for **SpringCard RFID Scanners** are NXP Desfire 4k (MF3ICD40 or MF3ICD41). You may buy them from **SpringCard** or any other NXP reseller.

SpringCard SQ844P is a software package featuring :

- A command line utility, that creates the Master Cards from a Master Configuration File, and using a SpringCard contactless reader/writer³²
- A wizard (HTML page) that helps authoring the Master Configuration File.

SpringCard SQ844P also includes various configuration files, that show typical configuration for Prox'N'Roll RFID Scanner, IWM-K632, FunkyGate, RDR-K632, ProxRunner, etc.

SpringCard SQ844P is available only for Microsoft Windows systems.

a. Downloading and installing

Go to www.springcard.com/download/sdks.html and download latest version of package **sq884p**.

Double-click the downloaded file to launch the installer, and follow the wizard.

b. The `cfgfilecreator.exe` command line utility

cfgfilecreator.exe is a Windows command line software.

Enter **cfgfilecreator.exe -h** to read the complete list of command line switches and options, and the complete list of sections and variables for configuration files.

cfgfilecreator.exe software comes with various sample configuration files that show typical configurations of IWM-K632, FunkyGate, Prox'N'Roll RFID Scanner, etc.

³² **SpringCard Prox'N'Roll PC/SC** (or Legacy) typically. CSB4 or any product in the CSB6 family may be used to create Master Cards too.

c. The *cfgfilecreator.exe* web page

cfgfilecreator.html is a standalone web page that helps creating configuration files for **cfgfilecreator.exe**.

8.2. CONFIGURATION FILES

cfgfilecreator.exe uses a configuration file to retrieve configuration data to be written into the Master Card.

Configuration files are written like standard Windows "INI" files. They can be created using Notepad or any other text editor, or using **cfgfilecreator.html**.

Each line of each section uses the format "name=value" where "name" is either the name or the tag of the configuration variable (e.g. either "opt" or "60"), and "value" its value in hexadecimal.

8.2.1. The "general" section

This section maps to tags h_{60} to h_{6F} . Default content is :

```
[general]
opt=05      ; value for OPT
odl=02      ; value for OD1
rdl=0A      ; value for RDF
clD=0F      ; value for CLD
cbz=13      ; value for CBZ
wgd=0A      ; value for WGD
dTC=0A      ; value for DTC
```

```
ser=C5      ; value for SER
shd=00     ; value for SHD
pin=0000   ; value for PIN
```

8.2.2. The "rkeys" section

This section holds the Mifare access keys to be written in RC's secure EEPROM. Type A keys are named "a0" to "a15", and type B keys "b0" to "b15".

Here's an example of content :

```
[rkeys]
a0=A0A1A2A3A4A5 ; Mifare type A base key (for MAD)
a1=FFFFFFFFFFFF ; NXP transport key
a2=000000000000 ; other transport key
a3=CCCCCCCCCCCC ; unused
(...)
a15=CCCCCCCCCCCC ; unused
b0=B0B1B2B3B4B5 ; Mifare type B base key (for MAD)
b1=FFFFFFFFFFFF ; NXP transport key
b2=000000000000 ; other transport key
b3=CCCCCCCCCCCC ; unused
(...)
b15=CCCCCCCCCCCC ; unused
```

This section (and each line in it) is optional. Only keys listed in this section will be written, other keys will be left unchanged.

8.2.3. Sections for Card Processing Templates

SpringCard RFID Scanners run 1 to 4 card accepting templates.

Each template is configured by sections "tpl1", "tpl2", "tpl3" and "tpl4" respectively.

Mandatory and optional content for each section depends on the card lookup list (LKL field) of the section itself.

a. ID-Only example

This sample section configures template 4 to read any kind of ID. Output format is : 8-byte fixed length, prefixed by the string "ID=" :

```
[tpl4]
lkl=0F      ; wants any kind of ID
tof=82     ; 8-byte output, swap 14443 A short IDs
pfx=49443D ; prefix = "ID="
```

b. Desfire example

This sample section configures template 1 to read 8 bytes of data from a Desfire card. Output format is : 8-byte fixed length, no prefix :

```
[tpl1]
lkl=71      ; wants Desfire cards
tof=02     ; 8-byte output
pfx=       ; no prefix
loc=123456 01 000100 08 ; 8 bytes of data to be read in application
                    ; 0x123456, field 0x01, at offset 0x000100
```

```
aut=00 A0A1A2A3A4A5A7 ; authentication with key 0, plain comm.  
; mode, no diversification. Key is a single  
; DES key (8 bytes)
```

8.2.4. Master Cards related sections

a. Specifying a new configuration for future Master Cards

The "tpl5" section allows to update the card processing template reserved to Master Cards. See paragraph 8.4.1 for details.

```
[tpl5]  
aut=E0 xx...xx ; 16-byte authentication key
```

This 16-byte authentication key in the "tpl5" section is the one that will be written in the reader(s) by the Master Card.

It is not the key that will be used to create the Master Card itself.

b. Specifying configuration to be used by current Master Card

The "master" section defines how the Master Card shall be created. See paragraph 8.4.2 for details.

```
[master]  
aut=E0 xx...xx ; 16-byte authentication key
```

This 16-byte authentication key in the "master" section is the one that will be used to create the Master Card.

It has no impact on the key written in the reader(s).

8.3. OPERATION INSTRUCTIONS

- Open **Configuration files creator (cfgfilecreator.html)** (on Windows : Start Menu → All Programs → SpringCard → Configuration Tools),
- Create your configuration file and save it in the directory where **cfgfilecreator.exe** is installed, for instance with the name *siteconf.ini* (on Windows : C:\Program Files\SpringCard\SQ844P),
- Open **Configuration tools directory** (on Windows : Start Menu → All Programs → SpringCard → Configuration Tools),
- Plug and power-on your Prox'N'Roll PC/SC (or legacy),
- Put a virgin Desfire card on the Prox'N'Roll PC/SC (or legacy),
- Enter **cfgfilecreator.exe -c siteconf.ini**,
- Wait until Master Card is written.

If the Desfire card is not virgin, the **software will try to format it** (i.e. erase the whole file structure with all the data) **without prior notification**.

Be sure to put on the reader only a virgin card, or an old Master Card to be overwritten.

You've been warned...

8.4. CHANGING AUTHENTICATION KEY FOR MASTER CARDS

All **SpringCard** products ship with the same out-of-factory authentication key. To secure their site, customers should replace the default key by their own key before installing the readers.

SpringCard recommends to make (and keep) at least two distinct Master Cards for each customer or site :

- **1st level Master Card** alters only the authentication key (replace default key by site specific key).
 - All readers bought for this site shall be configured using this **1st level Master Card** as soon as they are received.
- **2nd level Master Card** actually configures the reader (card processing templates, output mode and format, and so on).
 - It uses the site specific key for authentication, but doesn't update the key that is already inside the reader.
 - The **2nd level Master Card** shall be used during installation and whenever you wish to change reader configuration.

Note that more than one *2nd level Master Cards* can be created (one for each kind of output settings, one for each people in charge of installation...) whereas only one *1st level Master Card* should be created and be kept in a secure place³³.

Be sure to remember the new authentication key you put in a reader. If you forget the authentication key, and forget the pin-code (or define pin-code to `hFFFF`), it will be impossible to change reader configuration again !

You've been warned...

8.4.1. Creating a first level Master Card

- Create a configuration file (say, "*master.ini*") with only those 4 lines :

```
[master]
; Master section is empty, we use SpringCard's default keys

[tp15]
aut=E0 xx...xx
```

where *xx...xx* is the site specific 16-byte authentication key³⁴,

- Put a virgin card on the Prox'N'Roll, label it "*1st level Master Card*",
- Enter **cfgfilecreator.exe -c *master.ini*** ,
- Use this Master Card to write the new authentication key in the reader(s).

8.4.2. Creating a second level Master Card

- Create a complete configuration file as seen earlier .
- Terminate the file with those 4 lines :

```
[master]
aut=E0 xx...xx

[tp15]
; Template 5 section is empty, we keep current keys in the reader
```

where *xx...xx* is the site specific 16-byte authentication key,

- Put a virgin card on the Prox'N'Roll, label it "*2nd level Master Card*",
- Enter **cfgfilecreator.exe -c *siteconf.ini*** ,
- Use this Master Card to write complete configuration in the reader(s).

³³ That's because *1st level Master Card* has got the authentication key written in it, and anybody may retrieve it using **cfgfilecreator** software, as the authentication key is only used to secure *2nd level Master Cards* and is not written in them.

³⁴ This is key 0 inside Master Card application ; the key will be diversified using HMAC-MD5 algorithm, so the "E0" header is mandatory.

8.5. REVERTING TO DEFAULT

Sometimes it is necessary to put reader back in "out-of-factory" configuration (for instance when reader goes from one site to another). This is done easily by erasing all tags from reader's memory.

- Create a configuration file (say, "factory.ini") with only those 3 lines :

```
[master]
aut=E0 xx...xx
clear=1
```

where xx...xx is the site specific 16-byte authentication key

- Put a virgin card on the Prox'N'Roll, label it "Erase all Master Card",
- Enter **cfgfilecreator.exe -c factory.ini**
- Use this Master Card to put the reader(s) back in out-of-factory configuration.

Erasing all the configuration tags is not really sufficient to put the reader(s) back in out-of-factory configuration, since Mifare keys stored in RC's secure EEPROM are not erased.

Just add an "rkeys" section, with dummy keys, to overwrite those keys.

9. SPECIFICATION OF MASTER CARDS

This chapter is provided as a mean for security experts to evaluate the Master Card architecture of **SpringCard RFID Scanners**.

Customers do not need to implement this part themselves, since **cfgfilecreator.exe** software is a convenient tool to create Master Cards. See chapter 8 for details.

9.1. BUILDING A MASTER CARD

- The Master Card must be a Desfire 4k,
- The reader tries to fetch configuration data from Desfire cards according to the Master Card template specified in next paragraph. Data are protected by an authentication key that may be changed on a per-customer or per-site basis (i.e. Master Cards belonging to customer X will not work on customer Y's readers),
- Before storing new settings in its non-volatile memory, the reader checks that data comes with a valid digital signature. The signing key can't be changed, and is only known by **SpringCard's** software. This ensure that only data that has been pre-validated by a genuine software can be loaded in reader's non-volatile memory.

9.2. TEMPLATE FOR MASTER CARDS

9.2.1. Location of data

Name	Tag	Description	Size
LOC.MAS	$_{h}53$	Location of data in master cards. See table a below.	5

a. Data location bytes

Offset	Length	Content	Specified value
0	3	Application IDentifier (AID).	$_{h}504143$
3	1	File IDentifier (FID) for configuration data.	$_{h}01$
4	1	File IDentifier (FID) for digital signature.	$_{h}02$

9.2.2. Authentication key

Out-of-factory key used for authentication of Master Cards is confidential.

Only **SpringCard** genuine software –such as **cfgfilecreator.exe**– is able to create Master Cards with the default authentication key.

To secure their installation, customers should replace this key as soon as they receive the readers, as explained in 8.4 .

This is the same structure as AUT.DFR .

Name	Tag	Description	Size
AUT.MAS	$\text{h}55$	Authentication key. See table a below.	17

a. Authentication key bytes

Offset	Length	Content
0	1	Authentication key index and options. See table b below.
1	16	Authentication key for Master Cards (this is 3-DES key).

b. Authentication key index and options

Bit	Value	Meaning
7 – 6	00	Communication mode in read operation Plain
	01	MACed with session key
	10	<i>RFU</i>
	11	Enciphered with session key
5 – 4	00	Key diversification algorithm Use the key “as is”
	01	Diversify the key using Desfire SAM algorithm
	10	Diversify the key using HMAC-MD5 algorithm
	11	<i>RFU</i>
3 – 0	0000 to 1110	Index of key in Desfire application Index of the key to be used for authentication
	1111	<i>RFU</i>

Specified value : $\text{h}E0$ (key 0, HMAC-MD5 diversification, ciphered reading)

9.2.3. Signing key

Name	Tag	Description	Size
SGN.MAS	$\text{h}56$	Signing key. See table a below.	17

Key used for digital signature of master cards is confidential.

Only **SpringCard** genuine software –such as **cfgfilecreator.exe**– is able to sign the Master Cards³⁵.

Customers shall not try to change this parameter, unless advised to by **SpringCard**.

a. Signing key bytes

Offset	Length	Content
0	1	Index and options. See table b below.
1	16	Key data (this is 128-bits key).

b. Signing key index and options

Bit	Value	Meaning
7 – 6	00	Those bits are RFU and must be 00
5 – 4	00	Key diversification algorithm Use the key “as is”
	01	Diversify the key using Desfire SAM algorithm
	10	Diversify the key using HMAC-MD5 algorithm
	11	RFU
3 – 0	0000	Those bits are RFU and must be 00

Specified value : $\text{h}20$ (HMAC-MD5 diversification)

9.3. DATA STRUCTURE

9.3.1. Size of file

File holding configuration data and Mifare keys (offset 3 in LOC.MAS) must be exactly 512-byte long. In case used size is shorter than 512 bytes, file must be padded with $\text{h}00$.

9.3.2. Configuration data

The configuration data block uses the T,L,V (tag, length, value) encoding scheme.

- Tag is 1 byte-wide,
- Len is 1 byte-wide,
- Value is 0 to 24 byte-wide.

³⁵ This choice has been done to ensure that data inside the Master Card have been pre-validated according to reader specifications, and have not been corrupted afterwards.

Items found in T,L,V blocks will overwrite data with the same tag already present in reader's non-volatile memory.

Set Len = 0 to delete an existing tag from the non-volatile memory, without replacing it.

Last T,L,V of the configuration data block must be the (valid) signature of the whole block, according to the HMAC-MD5 digital signature algorithm specified in next chapter.

9.3.3. Mifare keys to be loaded into RC's secure EEPROM

Keys to be loaded into RC's secure EEPROM use the T,L,V scheme, as follow :

- Tag (1 byte) = $_{h}80$ + key index (see chapter "Mifare Classic Card Acceptance Template"),
- Len (1 byte) = $_{h}06$,
- Value is the Mifare key (6 bytes exactly).

9.4. DIGITAL SIGNATURE

9.4.1. Size of file

File holding the signature (offset 4 in LOC.MAS) must be exactly 16-byte long.

9.4.2. Algorithm

This is the signature algorithm when default parameters in SGN.KEY are used :

- Let *Content* be the 512-byte configuration block as written in the card³⁶,
- Let *SignKey* be the 16-byte key,
- Diversify *SignKey* from card's UID, using HMAC-MD5 diversification algorithm³⁷ to get *DivKey*,
- Compute *Sign* = HMAC-MD5 (*Block*) using *DivKey*³⁸.

The value of *SignKey* is confidential. Customers shall not try to change the key, nor the signature algorithm.

³⁶ This is the configuration data plus the Mifare keys to be loaded into RC's secure EEPROM. Total size is up to 512 bytes. Note that signature is computed over the whole file, including its padding, whatever the used length is.

³⁷ See next chapter "Security algorithms"

³⁸ See next chapter "Security algorithms"

10. SECURITY ALGORITHMS

10.1. HMAC SIGNATURE AND KEY DIVERSIFICATION

10.1.1. Abstracts

A message authentication code, or MAC, is a short piece of information used to authenticate a message. A MAC algorithm accepts as input a secret key and a message, and outputs a MAC that protects both message's integrity and authenticity.

An HMAC (or keyed-hash message authentication code) is a type of MAC function where a cryptographic hash function is used to compute the output.

a. HMAC algorithm

$$\text{HMAC}_K(m) = h\left((K \oplus \text{opad}) \parallel h\left((K \oplus \text{ipad}) \parallel m\right)\right),$$

Where h is the hash function, K is the secret key padded with extra zeros up to 64 bytes, m is the message to be authenticated. opad is the value $\text{h}5\text{C}$ repeated 64 times, and ipad the value $\text{h}36$ repeated 64 times.

b. HMAC-MD5

HMAC-MD5 is a particular HMAC function where h is the MD5 standard function, as defined by RSA laboratories. Size of HMAC is 16 bytes exactly.

In the **SpringCard RFID Scanners** family, we use HMAC-MD5 for both signature and key diversification.

10.1.2. HMAC-MD5 for digital signature

HMAC protects both message's integrity and authenticity, so it can be considered as a digital signature³⁹.

IWM implementation allows only 16-byte keys. The key can be used "as is" or be the result of a diversification from a master key.

10.1.3. HMAC-MD5 for key diversification

In this particular mode, we name K the "master key" and we compute the HMAC over card's identifier to establish a "diversified key" K_u .

³⁹ Literature often reserve the name "digital signature" to public key schemes, where verifier doesn't need to know signer's private key to verify the signature. HMAC is a scheme where signer and verifier must share the same secret key.

a. DES or Triple-DES key diversification

The algorithm takes as inputs :

- A 16-byte master key (Km)
- The card serial number (uid)⁴⁰

It provides as output :

- The 16-byte diversified key specific to this card (Ku).

The diversified key can now be used either for Desfire authentication, or for HMAC-MD5 signature.

b. Mifare key diversification

The algorithm takes as inputs :

- A 16-byte master key (Km)
- The 4-byte card serial number (uid)
- The 1-byte block address (adr)

It provides as output :

- The 6-byte Mifare key specific to the couple card + address (Ku).

Note : the *adr* parameter is the either the sector number (not the block number) or fixed to *h00*, depending on the configuration in the Mifare Classic Card Acceptance Template.

⁴⁰ The UID is 7-byte long for a Desfire card, 4-byte long for a Mifare card. The same diversification algorithm is usable whatever the length is.

10.2. DESFIRE SAM / RC171 KEY DIVERSIFICATION

10.2.1. DES or Triple DES key diversification

The key diversification algorithm described here is the one provided by Desfire SAM. Please refer to the corresponding datasheet for details.

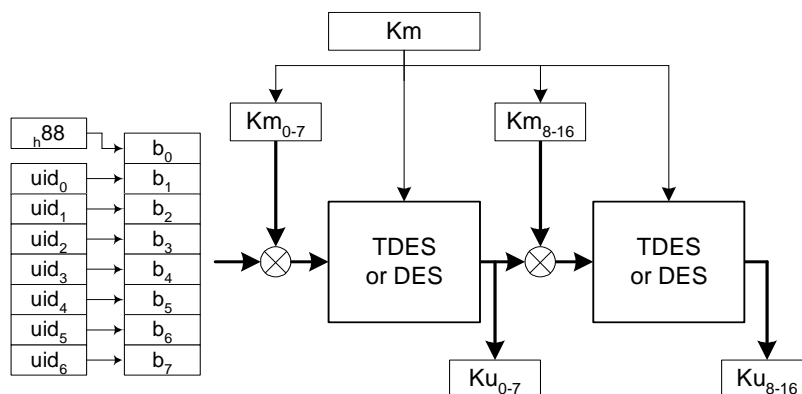

The algorithm takes as inputs :

- A 16-byte Triple-DES master key (K_m)⁴¹
- The 7-byte card serial number (uid)

It provides as output :

- The 16-byte diversified key specific to this card (K_u).

Here's the flowchart :

The diversified key now be used for Desfire authentication.

10.2.2. Mifare key diversification

The Mifare diversification algorithm described here is provided both by Desfire SAM and by NXP RC171 coprocessor. Please refer to the corresponding datasheets for details.

a. Basis

The algorithm takes as inputs :

- A 6-byte master key (K_m)
- A 16-byte Triple-DES diversification key (K_d)⁴²

⁴¹ If both halves are equals, the key maps to a single DES key

⁴² If both halves are equals, the key maps to a single DES key

- The 1-byte block address (adr)
- The 4-byte card serial number (uid)

It provides as output :

- The 6-byte Mifare key specific to the couple card + address (Ku).

Here's the flowchart :

b. Diversification based on UID only

If this option is selected, the *adr* input parameter is fixed to $_{h}00$ whatever the block to be read is.

c. Diversification based on UID and address

If this option is selected, the *adr* input parameter is the Mifare sector number (not the block).

Here's an example with a Mifare 1k card :

- Data is located on block 29,
- Block 29 belongs to sector 7 ($29 / 4$),
- The diversification algorithm will be fed with $adr = 7$.

Here's an example with a Mifare 4k card :

- Data is located on block 231,
- Block 231 belongs to sector 38 ($32 + (231-128) / 16$),
- The diversification algorithm will be fed with $adr = 38$.
